LETTER OF TRANSMITTAL.

September, 1928.

To His Excellency, THE HONORABLE C. C. YOUNG,
Governor of the State of California.

SIR: I have the honor to herewith transmit Bulletin No. 101 of the State Division of Mines and Mining, being the annual report of the statistics of the mineral production of California.

The remarkable variety, total valuation, and wide distribution of many of our minerals revealed herein show California's importance as a producer of commercial minerals among the states of the Union.

Respectfully submitted.

WALTER W. BRADLEY,
State Mineralogist.

INTRODUCTION

It is the endeavor of the staff of the State Mining Bureau (now Division of Mines and Mining of the State Department of Natural Resources), in these annual reports of the mineral industries of California, to so compile the statistics of production that they will be of actual use to producers and to those interested in the utilization of the mineral products of our state, while at the same time keeping the individual's data confidential. In addition to the mere figures of output, we have included descriptions of the uses and characteristics of many of the materials, as well as a brief mention of their occurrences.

The compilation of accurate and dependable figures is an extremely difficult undertaking, and the State Mineralogist takes the opportunity of here expressing his appreciation of the cooperation of the producers in making this work possible. A fuller appreciation of the value of early responses to the requests sent out in January will result in earlier completion of the manuscript. Statistics lose much of their value if their publication is unnecessarily delayed.

Some of the data relative to properties and uses of many of the minerals herein described are repeated from preceding reports, as it is intended that this annual statistical bulletin shall be somewhat of a compendium of information on California's commercial minerals and their utilization.

WALTER W. BRADLEY,
State Mineralogist.

MINERAL INDUSTRY, CALIFORNIA, 1927

DATA COMPILED FROM DIRECT RETURNS FROM PRODUCERS IN ANSWER TO INQUIRIES SENT OUT BY THE CALIFORNIA STATE DIVISION OF MINES AND MINING, FERRY BUILDING, SAN FRANCISCO, CALIFORNIA

CHAPTER ONE

The total value of the mineral output of California for the year 1927 was \$366,781,394, being a decrease of \$83,549,462 under the 1926 total of \$450,330,856. There were fifty-eight different mineral substances, exclusive of a segregation of the various stones grouped under gems; and all of the fifty-eight counties of the state contributed to the list.

As revealed by the data following, the salient features of 1927 compared with the preceding year were: A large drop in the value of petroleum in an amount greater than the net decrease in the grand total for all substances, being only partly offset by increases in other items. Material advances were made by borates, cement, potash, natural gas, granite, limestone, quicksilver, sandstone, and soda. Decreases were registered by copper, zinc, miscellaneous stone, brick, lead, salt, and silver. Petroleum showed a decrease in value of \$84,811,179, although there was an increase from 224,637,281 barrels to 231,195,774 barrels. This was due to a sharp cut in the price of crude oil, mainly for grades over 20° Baumé, effective April 16, 1927. There were a number of other minor variations, the result being a decrease in the totals of the fuels and metals groups, while all other groups showed increases.

Of the metals, titanium was added to the list, being the first year of any record of its production in commercial quantity in California; quicksilver increased from 5892 flasks worth \$516,382 to 6488 flasks worth \$714,418, this being accounted for by the advanced price received by the producers. In 1926 they received \$87.64 and in 1927, \$116.94 per 75-pound flask. Copper decreased from 33,521,544 pounds worth \$4,693,014 to 27,350,316 pounds worth \$3,582,885; gold from \$11,923,481 to \$11,671,018; lead from 8,067,873 pounds worth \$645,429 to 2,748,440 pounds worth \$173,151; silver from 2,022,460 fine ounces worth \$1,262,015 to 1,620,242 fine ounces worth \$918,677; and zinc from 20,447,559 pounds worth \$1,533,568 to 8,625,004 pounds worth \$552,000. The decrease in copper, lead and zinc was due to a drop in the market prices, while the gold and silver, by-products of these ores, account for the decreases in the total gold and silver figures. Though

the gold yield decreased in value, California continues in the lead, and in 1927 accounted for approximately 26 per cent of the gold output of the United States.

Of the structural group: Cement advanced from 13,797,173 barrels valued at \$25,269,678 to 14,661,783 barrels at \$26,474,935, though the average price per barrel dropped from \$1.84 to \$1.80; granite increased in value from \$655,332 to \$1,398,443, and sandstone from \$17,500 to \$205,400; brick and hollow building tile dropped from a valuation of \$7,026,124 to \$6,516,077, and miscellaneous stone from \$19,859,873 to \$18,912,994; of the remaining minerals in this group there were no material changes. Of the industrial minerals there were a number of fluctuations with a general trend of increasing production and value. The important changes were: pottery clay with an increase from 797,461 tons valued at \$806,509 to 867,419 tons and \$872,661; limestone from 108,795 tons valued at \$367,501 to 899,790 tons and \$663,957. Of the saline group, borates showed an increase from 47,605 tons valued at \$1,625,298 to 72,462 tons at \$3,043,260; potash, 32,884 tons valued at \$812,285 to 67,340 tons and \$1,952,852; and salt showed a decrease from 311,761 tons valued at \$1,124,978 to 263,028 tons and \$639,127.

The figures of the State Division of Mines and Mining are made up from reports received direct from the producers of the various minerals. Care is exercised in avoiding duplication, and any error is likely to be on the side of under- rather than over-estimation.

California yields, commercially, a greater number and variety of mineral products than any state in the United States, and probably more than any other equal area elsewhere on the earth. The total annual value of her output has been surpassed by not more than four or five others, and those usually the great coal states of east of the Mississippi. More recently California has been placed second to Pennsylvania, the leader. California was for many years the sole domestic source of borax, chromite and magnesite, and in which we still lead. We lead all other states in the production of gold, quicksilver, and platinum; and have alternated in the lead with Colorado in tungsten, and with Oklahoma in petroleum.

The mineral industries, not only in California, but throughout the country, have reached quite a different phase from that of the old gold-rush days more than fifty years ago. A broader and more intimate status has been attained, touching practically every avenue of domestic and commercial endeavor. As quoted in a former report¹ of the freight handled by the railroads of the country, the products of the mines represent 51.33 per cent. While gold, in which California still leads the United States, is still important, other metals and even nonmetals have superseded it in annual value. The greatest commercial developments proportionately in California in recent years have taken place among the industrial and structural minerals, not to mention petroleum, which leads all others in value. This introduces a new factor which requires study and attention—that of marketing. The gold miner could, and still does, take his metal to the mint and receives

¹ Cal. State Min. Bur., Bulletin 96, p. 12, 1925.

its equivalent in the 'coin of the realm'; and he knows from day to day and year to year, without variation, just how much each ounce of gold will bring in that coin, though its equivalent in other commodities varies according to economic conditions. Marketing and competition, however, are vital factors in the industrial and structural groups.

By Substances.

The following table shows the comparative yield of mineral substances of California for 1926 and 1927, as compiled from the returns received at the State Division of Mines and Mining, San Francisco, in answer to inquiries sent to producers:

Substance	1926		1927		Increase + Decrease—
	Amount	Value	Amount	Value	
Barytes-----	4,978 tons	\$38,165	17,993 tons	\$90,617	\$52,452+
Bituminous rock-----	3,863 tons	21,577	3,515 tons	17,704	3,873-
Borates-----	47,605 tons	1,625,298	72,462 tons	3,043,260	1,417,962+
Brick and hollow building tile-----	13,797,173 bbls.	7,926,124	14,661,783 bbls.	6,516,077	510,047-
Cement-----	395 tons	25,269,678	225 tons	26,474,935	1,205,257+
Chromite-----	797,461 tons	7,063	867,419 tons	5,083	2,100-
Clay (pottery)-----	1,100 tons	806,509	867,419 tons	872,661	66,152+
Coal-----	33,521,544 lbs.	5,000	27,350,316 lbs.	3,582,885	1,110,129-
Copper-----	68,640 tons	4,693,014	45,976 tons	34,422	39,891-
Dolomite-----	7,300 tons	119,313	10,932 tons	86,101	29,701+

Zirconium	1,533,558	552,000	981,558
Unapportioned	a 1,233,012	* 1,273,522	40,510
Total values	\$450,330,856	\$366,781,394	\$83,549,462
Net decrease			

* Included under 'Unapportioned.'

a Includes onyx and travertine.

b Combined with marble.

c Includes macadam, ballast, rubble, riprap, sand and gravel, paving blocks, and grinding mill pebbles.

d Includes antimony, asbestos, bromine, calcium chloride, diatomaceous earth, iron ore, lithia, shale oil, sillimanite-andalusite-cyanite

group. e Includes antimony, asbestos, bromine, coal, graphite, diatomaceous earth, heptane, iron ore, lithia, magnesium salts, mineral

paint, shale-oil, sillimanite-andalusite-cyanite group, slate, titanium and tungsten.

By Counties.

The following table shows the comparative value of the mineral production of the various counties in the state for the years 1926 and 1927:

	1926	1927
Alameda	\$3,158,474	\$2,577,787
Alpine	450	5,306

Totals	\$450,330,856	\$366,781,394

Total Mineral Production of California, by Years.

The following tabulation gives the total value of mineral production of California by years since 1887, in which year compilation of such data by the State Mining Bureau (now Division of Mines and Mining) began. At the side of these figures the writer has placed the values of the most important metal and non-metal items—gold and petroleum.

In the same period copper made an important growth beginning with 1897 following the entry of the Shasta County mines, and more recently Plumas County. Cement increased rapidly from 1902, while crushed rock, sand and gravel as a group parallels the cement increase. Quicksilver has been up and down. Mineral water and salt have always been important items, but the values fluctuate. Borax has increased materially since 1896. War-time increases, 1915–1918, were shown by chromite, copper, lead, magnesite, manganese, silver, tungsten and zinc. Most of these, except silver, have since declined, though structural materials and copper increased in 1920–1924, also lead and magnesite in 1923; lead and zinc in 1925; zinc in 1926, with silver declining; an increase in quicksilver in 1927, with a decline in all other metals.

Total Mineral Production of California, by Years, Since 1887.

Year	Total value of all minerals	Gold, value	Petroleum, value
1887	\$19,785,868	\$13,588,614	\$1,357,144
1888	19,409,320	12,750,000	1,380,666
1889	16,681,731	11,212,913	368,048
1890	18,039,666	12,309,793	384,200

2-62279

CHAPTER TWO

FUELS (Hydrocarbons)

Among the most important mineral products of California are its fuels. This subdivision includes coal, natural gas, and petroleum, the combined values of which made up practically 77 per cent of the state's entire mineral output for the year 1927.

There are deposits of peat known in several localities in California, small amounts of which are used as a fertilizer, and in stock-food preparations, but none has yet been recorded as utilized for fuel.

Comparison of values during 1926 and 1927 is shown in the following table:

<i>Substance</i>	<i>1926</i>		<i>1927</i>		<i>Increase + Decrease— Value</i>
	<i>Amount</i>	<i>Value</i>	<i>Amount</i>	<i>Value</i>	
Coal	1,100 tons	\$5,000	244,686.940 M cu. ft.	\$20,447,254	\$981,947 +
Natural gas	214,549,477 M cu. ft.	19,465,347	231,195,774 bbls.	260,735,498	84,811,179 +
Petroleum	224,673,281 bbls.	345,546,677		5,100	
Unapportioned					
Total value		\$365,017,024		\$281,187,892	\$83,829,132 —
Net decrease					

* Includes coal and heptane.

COAL

Bibliography: State Mineralogist Reports VII, XII-XV (inc.), XVII, XIX-XXI (inc.). U. S. Geol. Surv., Bulletins 285, 316, 431, 471, 581; Ann. Rept. 22, Pt. III.

The coal production in California for 1927 was limited to Amador County. This was consumed by a local market and also on the property for camp purposes, power and forge, to carry on regular operation and development work.

Total Coal Production of California.

The very considerable output of coal in the years previous to 1883 was almost entirely from the Mount Diablo district, Contra Costa County. Later the Tesla mine in Corral Hollow, Alameda County, was an important producer for a few years. Stone Canyon, Monterey County, was also an important producer for a short time, and there has been some coal shipped from properties in Amador, Fresno, Orange, Riverside and Siskiyou counties. The following tabulation gives the annual tonnages and values, according to available records:

Coal Output and Value by Years.

Year	Tons	Value	Year	Tons	Value
1861.....	6,620	\$38,065	1896.....	70,649	\$161,335
1862.....	23,400	134,550	1897.....	87,449	196,255

* Under 'Unapportioned.'

The tonnages in the above table for the years 1861-1886 (incl.) are taken from the U. S. Geological Survey, "Mineral Resources of the U. S., 1910," p. 107. The values assigned for the years previous to 1883 are those given by W. A. Goodyear (Mineral Res., 1882, pp. 93-94), being an average of \$5.75 per ton. From 1887 to date the figures are those of the California State Mining Bureau.

HEPTANE

Heptane was added to the list of hydrocarbons this year. There was a production reported as a by-product of bromine recovery from bittern water of San Diego County.

Heptane is used as a solvent of alkalies in vegetable oils, an antiseptic, a starter for other organic compounds, and as an ideal fuel. The reason for its value in these uses is its definite chemical composition and its boiling point at 98° C., just under the boiling point of water.

NATURAL GAS

Bibliography: State Mineralogist Reports VII, X, XII, XIII, XIV. Bulletins 3, 16, 19, 69, 73, 89. Monthly Summary, Oil & Gas Supervisor, Dec., 1919; Aug., 1922; Mar., 1923; Mar. and Apr., 1926.

Statistics on the production of natural gas in California are in a considerable degree difficult to arrive at, as much of it that is utilized directly at the wells for heating, lighting, and driving gas engines is not measured. Hence, it is necessary to approximate the output of many of the operators in the oil fields, estimated on the number of lights, and on the number and horsepower of gas engines and steam boilers thus operated. The figures here given are for gas utilized locally and also that sold for distribution to consumers; and we consider are not over-estimated, particularly in the six oil-producing counties. It must be remembered that some of our important oil fields are removed many miles from the site of any other industry, and that the gathering of small amounts of gas and transporting it for any considerable distance may not always be profitable, nor is it often possible to have pipe-line facilities available to handle the gas accompanying the early gas production in newly developed fields. Wherever feasible, casing-head gas is used in driving gas engines for pumping and drilling, and in firing the boilers of steam-driven plants.

The most notable gas developments in California have been in the Elk Hills and Buena Vista Hills in Kern County, northeast of the Midway district; in the oil fields in the Los Angeles basin, Los Angeles and Orange counties; and more recently in Ventura County.

Production and Value.

There is rather a wide variation in prices quoted for natural gas because a considerable part is used directly in the field for driving gas engines and firing boilers, and is therefore not measured nor sold. Such companies as have placed a valuation on the gas that was thus used in 1927 gave from 3¢ to 25¢ per 1000 cu. ft., at the well. From the totals shown in the tabulation following herein, the average value for all fields in 1927 works out at approximately 9.1¢. Approximately 7000 cu. ft. of gas is equal to one barrel of oil in heating value, and is so accounted for by many operators. In driving gas engines, about 4000 cu. ft. per 24 hr. are consumed by a 25-h.p. engine, and 63,700 cu. ft. per day for heating a 70-h.p. steam boiler, which figures have been utilized in compiling this report, in those cases where gas was not metered.

Natural Gas 'Consumed,' or Utilized for Fuel, 1927

County	M cu. ft.	Value
Fresno	1,682,652	\$148,227
Kern	39,401,428	2,057,807
Los Angeles	420	220
Orange	440	220
Santa Barbara	59,749,559	7,117,081
Ventura	50,981,982	3,910,501
Humboldt	1,701,715	204,775
Mendocino	71,036,201	6,951,273
Sacramento and San Mateo*	132,538	57,190
Totals	224,686,940	\$20,447,294

* Combined to conceal output of a single operator in each.

The above totals for 1927 compare with 214,549,477 M cu. ft. valued at \$19,465,347 in 1926. Important increases in quantity in 1927 were made by Ventura County, which showed 71,036,201 M cu. ft. worth \$6,951,273, compared with 41,559,144 M cu. ft. worth \$4,080,040 in 1926, and Orange County, with 50,981,982 M cu. ft. worth \$3,910,501, compared with 33,276,379 M cu. ft. worth \$3,556,194 in 1926. Fresno, Kern, Los Angeles and Santa Barbara counties utilized somewhat smaller quantities of natural gas, but there was a larger quantity of natural gas gasoline treated.

Natural Gas Production in California, Since 1888.

The production of natural gas in California by years since 1888 is given in the following table. The first economic use of natural gas in California was from the famous Court House well at Stockton, bored in 1854-1858. Beginning about 1883 and for several succeeding years, a number of gas wells were brought in around Stockton. Natural gas was known in a number of other localities, and occasionally utilized in a small way, notably at Kelseyville in Lake County, and in Humboldt County near Petrolia and Eureka, but there are no available authentic records of amounts or values previous to the year 1888. The most important developments in the commercial production of natural gas have been coincident with developments in the oil fields, by utilizing the casing-head gas as well as that from dry-gas wells.

Year	M cubic feet	Value	Year	M cubic feet	Value
1888	•12,000	\$10,000	1909	1,148,467	\$616,932
1889	•14,500	12,680	1910	10,579,933	1,676,367
1890	•41,250	33,000	1911	•5,000,000	491,859
1891	•39,000	30,000	1912	•12,600,000	940,076
1892	•75,000	55,000	1913	14,210,836	1,053,292

* Quantity, in part, estimated, where values only were reported.
 † Includes natural CO₂ from a mine in Santa Clara County.

Gasoline from Natural Gas.

More or less gas usually accompanies the petroleum in the oil fields, and such gas carries varying amounts of gasoline. A total of 142 plants were in operation in 1927 recovering gasoline by compression or absorption from this 'casing-head' gas. After the gasoline is extracted the remaining 'dry gas' so far as practicable is taken into pipe lines, by which it is distributed to consumers, both domestic and commercial.

In certain of the oil fields, some of the casing-head gasoline is obtained as an incidental product to the compressing of the natural gas preliminary to its transmission to consuming centers through the gas pipe lines. Some concerns market the casing-head gasoline separately, others blend it with distillery gasoline, while others turn it into the oil pipe lines thus mixing this high-gravity gasoline with the crude oil for transportation to the refinery where it is later regained. A total of 489,798,683 gallons of casing-head gasoline valued at \$45,700,264 from all fields was reported as made by 142 plants during 1927, compared with 389,026,757 gallons valued at \$51,788,346 from 148 plants in 1926. It was distributed by counties as follows:

Natural-Gas Gasoline Recovered, 1927			
County	No. plants	Gallons	Value
Fresno	1	1,460,000	\$133,860
Kern	34	82,411,525	8,488,387
Los Angeles	53	162,042,699	16,364,313
Orange	38	78,346,009	7,834,601
Santa Barbara	4	12,008,500	1,200,850
Ventura	12	153,529,950	11,678,253
Totals.....	142	489,798,683	\$45,700,264

The usual recoveries of gasoline from natural gas vary from $\frac{1}{2}$ gal. to 3 gal. per 1000 cu. ft. of gas handled, the average being about 1 gal. per 1000 cu. ft. The U. S. Bureau of Mines report by Knudsen¹ gives the average recovery for 1927 as 1.457 gallons per 1000 cu. ft. of gas treated. His figures show the following production, by methods:

Natural-Gas Gasoline Production, 1927, by Methods (Per U. S. Bureau of Mines)		
Method	Gallons	Recovery (Gal. per M cu. ft.)
Oil absorption	266,915,524	1.523
Compressor	4,859,675	1.541
Combination compressor and oil absorption.....	176,149,048	1.546
Combination oil and charcoal absorption.....	40,886,138	1.165
Charcoal absorption	762,263	.088
Drip	169,865	---
Totals.....	489,742,513	1.457

Surv., Bulletins 213, 285, 309, 317, 321, 322, 340, 357, 398, 406, 431, 471, 541, 581, 603, 621, 623, 653, 691; Prof. Papers 116, 117. "American Petroleum; Supply and Demand"; Amer. Petr. Inst., 1925.

The crude petroleum produced in California for 1927 amounted to a total of 231,195,774 barrels of clean oil, valued at \$260,735,498 at the

¹ Knudsen, E. T., Statistical summary of California petroleum industry, 1927; U. S. Bureau of Mines, 1928, pp. 45, 46.

well. This total of quantity is compiled from the monthly production reports filed by the operators with the State Oil and Gas Supervisor, to which have been added figures for the output of a number of small operators in the old Los Angeles City Field not under the jurisdiction of the Supervisor.

The question of the value of the crude oil yield at the well is a difficult one to settle with exactitude principally because a large part of the output is not sold until after refining. The large refiners are also large producers of crude oil which they send direct from well to plant, hence much of the crude oil is not sold as such. The values used in the statistical reports of the State Mining Bureau since 1914 have been derived from averages of actual sales of crude oil of all grades in each field of the state, and these averages applied to the total yield of the respective fields. This we feel is a safer measure of commercial values than market quotations, because quotations do not always mean sales. This is particularly true on a rising or a falling market.

Features of 1927.

The noteworthy features of the year 1927 in the oil industry were increased output in Orange, Santa Barbara and Ventura counties and decreases in all other counties. There were sharp cuts in the price of crude oil in all grades over 20° Baumé, making the value in all counties less than in 1926.

Summarizing the data for the year, the State Oil and Gas Supervisor¹ presented the following figures:

"The total production of oil in the state for the last six months of 1927 was 114,891,618 barrels of oil and 58,897,272 barrels of water. The production of oil for the year 1927 was, therefore, 231,045,773 barrels, an increase of 6,522,349 barrels over that of 1926. The increased production came from the Seal Beach and Huntington Beach fields and while the Ventura field increased over 3,000,000 barrels, there was a nearly equal decrease in the fields of Kern County.

"The production of oil for the second half of 1927 was 1,262,537 barrels less than for the first half. Water production increased 3,290,754 barrels during the same period.

"The estimated closed-in production was increased during 1927 from 61,314 barrels daily in January to a maximum of 89,442 barrels daily in May and decreasing to 77,107 barrels daily in December. * * *

"Storage and Price Changes.

"The total crude oil and refined petroleum in storage in Pacific coast territory at the end of 1927 was 137,395,067 barrels, according to the American Petroleum Institute. The decrease in storage during the year amounted to 8,217,109 barrels compared with a decrease of 11,704,133 barrels during 1926. The total amount of crude and refined oil shipped to eastern ports during 1927 was 33,080,000 barrels, or 42,000 barrels more than the 1926 shipments.

"On April 1, 1927, prices of crude oil of 15 degrees gravity and above in some fields, and of 19 degrees gravity and above in other fields, were lowered.

"Drilling and Development.

"During 1927, 1263 wells were reported to the State Oil and Gas Supervisor as ready to drill as compared with 1263 new wells in 1926. Five new fields were discovered in 1927, most of which are relatively unimportant. These fields were the Alamitos dome of the Seal Beach field, the Potrero field in Los Angeles County, the Rincon field in Ventura County, the Goleta field in Santa Barbara County, and the Round Mountain field in Kern County. Of these, the most important was the extension of the Seal Beach field, which contributed much to the 1927 production. The productive possibilities of the Rincon, Potrero and Round Mountain fields had not been determined at the end of the year. The Goleta field produced a small amount of high gravity oil and apparently reached its limit."

During 1927 there was a small production of high-grade petroleum from Colusa County. This was marketed for medicinal purposes.

¹ Bush, R. D., *Résumé of Oil Field Operations of California in 1927*; Cal. State Min. Bur., 13th Ann. Rep. of State O. & G. Super., No. 8, Feb. 1928, pp. 5 and 6.

Production Figures.

The following table gives the production and value by counties for 1927 compared with the 1926 figures:

TABLE A
Production and Value of Crude Oil, by Counties

County	1926		1927	
	Barrels	Value	Barrels	Value
Fresno	7,340,102	\$5,982,183	7,202,285	\$5,977,176
Kern	54,549,616	78,987,887	51,570,412	58,738,699
Los Angeles	105,826,337	174,084,324	103,625,615	114,583,011
Orange	37,989,349	59,225,395	46,593,842	56,238,767
San Luis Obispo	27,982	22,162	16,709	12,531
Santa Barbara	1,925,204	1,526,587	2,173,887	1,630,415
Santa Clara	a		11,994	14,212
Ventura	16,994,275	25,695,344	19,996,841	23,536,282
Kings, San Bernardino, San Mateo, Santa Clara, Sonoma	* 20,386	22,795	-----	-----
Colusa, Kings, San Bernardino, San Mateo, Sonoma	-----	-----	* 4,189	4,405
Totals	224,673,281	\$345,546,677	231,195,774	\$260,735,498

* Combined to conceal output of a single operator in each.

The foregoing totals show the average price of \$1.127 per barrel for the year 1927 as compared with \$1.538 in 1926, \$1.422 in 1925 and \$1.200 in 1924.

TABLE B
Average Price of Oil per Barrel, by Counties, 1918-1927

County	1918	1919	1920	1921	1922	1923	1924	1925	1926	1927
Fresno	\$0.825	\$1.191	\$1.293	\$1.483	\$1.068	\$1.710	\$1.162	\$1.094	\$0.815	\$.830
Kern	.893	1.252	1.350	1.714	1.211	.819	1.137	1.432	1.448	1.139
Los Angeles	1.176	1.340	1.380	1.532	1.403	.971	1.239	1.429	1.645	1.115
Orange	1.003	1.412	1.860	2.138	1.175	.880	1.183	1.417	1.559	1.207

Ventura	1.318	1.480	1.635	2.507	1.785	1.138	1.334	1.710	1.512	1.177
State average	\$0.908	\$1.278	\$1.409	\$1.726	\$1.249	\$0.923	\$1.200	\$1.422	\$1.538	\$1.127

For several years previous to 1919, the state average value per barrel at the well for crude oil as determined by the statistical returns was noted to practically coincide with the quotations during the same years for 23° gravity oil in the San Joaquin Valley fields. In 1919 and since, the average values have worked out at figures corresponding to quotations up to, in one year as high as 28° oil, due to the large yield of high-gravity oils from the new fields in the Los Angeles-Orange counties area.

TOTAL PETROLEUM PRODUCTION OF CALIFORNIA

The presence of oil seepages and springs in Los Angeles and Ventura counties was known and utilized in a small way early in the history of California. Some also was shipped to refineries at San Francisco from Santa Barbara and Humboldt counties. In the light of present-day

developments, the following reference to the previous year's production of oil and its future prospects as expressed by the San Francisco Bulletin of January 8, 1866, is strikingly prophetic even though skeptical:

"It is possible that the small quantity received (40,000 or 50,000 gallons in 1865) may be the forerunner of many millions which will, at some future time, lubricate the wheels of commerce and set a trade at work excelling in variety any that has thus far been known on this coast. At present, however, we admit to being a little skeptical about the assumption of the astute Professor Silliman that California will be found to have more oil in its soil than all the whales in the Pacific Ocean."

According to Hanks,¹ in 1874 production amounted to 36 bbl. per day from natural flows in Pico Cañon (Newhall), and at Sulphur Mountain (Ventura County), the oil being of 32° gravity average.

²"Work was commenced in Pico Canyon in 1875 by drilling three shallow wells with spring pole, all of which yielded oil at depths of from 90 to 250 feet. Actual work of development commenced with steam machinery in 1877."

In 1877 Pico averaged 40-50 bbl. daily, and Ventura 80 bbl. daily. In 1878, there was some production (@ 60 bbl. per day, for a time) from wells in Moody Guleh, near Los Gatos, Santa Clara County, the oil being of 46° Baumé.

The first wells in the Coalinga, Fresno County, and Summerland, Santa Barbara County, fields were drilled in 1890, but Coalinga did not make its influence felt conspicuously on the state's annual output until 1903. The Summerland yield never has been large. The Salt Lake field near Los Angeles began production in 1894 and in 1897 reached over a million barrels annually.

In the Kern County fields, the first well was drilled in Sunset in 1891, Midway in 1900, McKittrick in 1892, Kern River in 1899. The Sunset-Midway district attained a yield of over 4,000,000 bbl. in 1909, and over 20,000,000 bbl. in 1910. Kern River field produced over 3,000,000 bbl. in 1901.

The first well in the Santa Maria-Lompoc group, Santa Barbara County, was drilled in 1901, and the district advanced to a yield of over 3,000,000 bbl. annually in 1905.

The Whittier-Fullerton field in Los Angeles and Orange counties became an important factor in 1902. The Montebello field, Los Angeles County, was the conspicuous addition in 1918-1919; and Elk Hills, Kern County, with Huntington Beach and Richfield, Orange County, in 1920. In 1921, the new fields added were Long Beach and Santa Fe Springs, Los Angeles County; in 1922, Torrance field in Los Angeles County, and Wheeler Ridge field in Kern County; but the production from the large number of new wells started in these new Los Angeles County fields did not reach its peak until August and September, 1923. Dominguez (Compton) came in during 1923; followed by Rosecrans and Inglewood in 1924. Ventura recorded important additions to its producing area in 1925 and 1926. Seal Beach, Orange County, and Mt. Poso, Kern County, were the new fields added in 1926; Round Mountain, Kern County, and Rincon, Ventura County, were the new fields added in 1927.

¹Hanks, Henry G., Report IV of State Mineralogist, p. 298, 1884.

²*Idem*, p. 301.

The effect of the advent of these various fields to the producing column will be noted in the tabulation herewith, by years:

† State average.

Specific Gravity of Oils Produced.

The proportion of heavy and light oil produced in the various fields is shown in Table E, following, for which we are indebted to the Standard Oil Company. Under present practice, oil below 18° Baumé may be considered as largely refinable for fuel and lubricants, while the lighter oils yield varying amounts of the higher refined products with corresponding proportions of residuum and fuel oil. Specific gravities in California range from 8° Baumé in the Casmalia field, Santa Barbara County, to 56° Baumé in Ventura County.

California crude oils are all essentially of asphalt base, with a few notable exceptions. In the following localities are wells yielding crudes containing both asphalt and paraffine constituents: Oil City field, Coalinga; a few deep wells in East Side field, Coalinga; a considerable part of the Ventura County fields; Western Minerals area, south of Maricopa; Wheeler Ridge, Kern County.

* Formerly reported as Whittier-Fullerton.

As previously noted by Bradley,¹ a decided change has taken place in the relative proportions of light and heavy crudes produced in California since 1910, taking 18° Baumé as the dividing line. This subject has also been covered in detail and with charts, by Collom and Barnes.²

A marked drop took place in the low-gravity yield from 1910 to and including 1914. From 1914, it remained almost stationary, with a slight drop in 1921, while the high-gravity yield has increased at a rapid rate since 1915. The proportions have been reversed from approximately 75% low—25% high in 1914 to 25% low—75% high in 1921; 10% low—90% high in 1923; 14% low—86% high in 1924—1927.

This has been an important factor in its effect upon the average price per barrel of the state's output in these years, as well as its effect upon the relative situation between production and consumption. It has been a fortunate development, in view of the increased demand for refinery products (gasoline in particular).

Oil in 'Storage.'

Field, refinery, pipe-line, and tank-farm stocks of crude and refined products in the Pacific Coast territory totaled 137,395,067 barrels³ December 31, 1927, compared with 145,612,176 barrels on December 31, 1926. The total decrease in stock for the year was 8,217,109 barrels.

<i>Stocks</i>	<i>Dec. 31, 1927</i> <i>(barrels)</i>	<i>Dec. 31, 1926</i> <i>(barrels)</i> <i>(revised)</i>
Heavy crude, heavier than 20° A. P. I., including all grades of fuel-----	93,013,061	88,707,499
Refinable crude, 20° A. P. I. and lighter-----	20,268,569	30,835,057
Gasoline-----	12,725,841	11,673,563
Naphtha distillates-----	1,901,279	3,832,042
All other stocks-----	9,486,317	10,564,015
Totals of all stocks-----	137,395,067	145,612,176

Operating Data.

The following tabulation (Table F) is compiled from data published by the Department of Petroleum and Gas,¹ semiannually, and here combined to show the entire year's operations for all fields. The districts are the geographical subdivisions as administered by the Department, and which are outlined on the accompanying map.

It will be noted that the state average yield of oil per well per day was 62.0 barrels for the first six months of 1927 and 59.6 barrels for the second. This is somewhat higher than the figure of 54.1 barrels average for December derived from American Petroleum Institute data as shown in Table D, on a preceding page, due in part at least, to the fact that the latter is on a full-time basis, whereas the Bureau figures allow for shut-down time.

¹ Summary of Operations, California Oil Fields; Cal. State Min. Bur., Thirteenth Ann. Rep. of State Oil and Gas Supervisor, Aug., 1927, pp. 6-7; Feb., 1928, pp. 8-9.

Financial and Operating Conditions of California Oil Fields, 1927.

Financial results of the oil business during 1927 are shown by the following tables. The features worthy of mention are: (1) There were 487 operating companies in 1927 with a total capitalization value of \$1,272,555,286 (see Table G), which was a decrease in the number of companies from 491 in 1926 with an increased capitalization from \$1,241,242,935. (2) A total increase in dividends was paid, with all counties showing an increase over their 1926 dividends, with the exception of Fresno and Santa Barbara (see Table H). (3) An increase in the barrels per well per day (see Table I) in Santa Barbara and Ventura counties, with a decrease in all other counties and a marked drop in Los Angeles County. (4) A slightly less operating cost in all counties with the exception of Los Angeles and Orange.

With reference to Table I, it should be noted that although it lacks data from the larger operators who have refineries and with interests in more than one field, yet the data given are of economic value and interest in that they indicate the conditions prevailing among the smaller companies and operators.

Operating cost per well is not always lower for the dividend companies than others. Profitable operations seem to depend generally upon large wells, high-grade oil, and proximity to market. Price and profits have usually been greater in the Los Angeles-Orange-Ventura fields than in others, doubtless largely due to the proximity to market and higher grades of oil. Crude oil testing as high as 56° Baumé is obtained from some of the Ventura wells.

TABLE G. Capitalization

Santa Barbara County.....	0.754	0.742	0.750	1.355	45,276	14.554	78,470	0.241
Ventura County.....	0.799	1.179	1.177	1.300	24,810	13.996	24,540	0.618

*See Table G, preceding. Does not include companies with refineries, nor those operating in several fields whose data could not be segregated as to counties or fields. The data given are of value, however, as showing the conditions obtaining among the smaller operators.

*See Table H, preceding.

It should be noted that in the case of a county like Ventura, with only a few producers, the averages are not so significant as in other fields with a large number of operators. The figures of a single large operator in such a case can materially affect the general average if they should be much above or below the average of the others.

Proved Oil Land.

The total proved oil land of the state is 125,131 acres, an increase during 1927 of 3696 acres. Of this amount 23,927 acres, being owned by federal, state and city governments, or for other reasons, is not assessable for the support of the Department of Petroleum and Gas of the Division of Mines and Mining. The acreage in 1927 was distributed by counties as follows:

TABLE J
Proved Oil Lands and Number of Wells, 1927

<i>County</i>	<i>Land (acres)</i>	<i>Number wells Dec. 31, 1927</i>
Fresno -----	14,665	985
Kern -----	80,075	5,574
Los Angeles* -----	10,794	3,311

Santa Clara -----	80	4
Ventura -----	4,938	699
Kings, San Bernardino and Sonoma -----	---	3
Totals -----	125,131	12,345

*Not including the old Los Angeles city field.

CHAPTER THREE

METALS

Bibliography: Reports of State Mineralogist I-XXII (inc.). Bulletins 5, 6, 18, 23, 27, 36, 50, 57, 76, 78, 85, 92, 95. Spurr and Wormser, "Marketing of Metals and Minerals." See also under each metal.

The total value of metals produced in California during 1927 was \$17,990,841. The chief of these is, and always has been, gold, followed by copper, silver, quicksilver, zinc, tungsten, lead, titanium, iron ore and platinum. There was a small output of antimony. There was no production of arsenic, cadmium, molybdenum, nor tin, which have in the past been on the active list. Deposits of ores of nickel and vanadium have also been found in the state; although there has yet been no commercial output of them. The above-noted total of this group is a net decrease of \$2,937,903 from the 1926 total of \$20,928,744, due mainly to decreases registered by copper, gold and silver, in spite of an increase by quicksilver.

California leads all states in the Union in her gold production and is credited with approximately 26% of the nation's yield in 1927. The precious metal is widely distributed through the state. Thirty-four of the fifty-eight counties reported an output in 1927 from either mines or dredges.

Copper, which is second in importance among the metals of the state, occurs in the following general districts: the Shasta County belt, which has been by far the most important; the Coast Range deposits, extending more or less continuously from Del Norte in the north to San Luis Obispo County in the south; the Sierra Nevada belt, starting in Plumas and running in a general southerly and southeasterly direction through the Mother Lode counties and ending in Kern; the eastern belt in Mono and Inyo counties, and the southern belt in San Bernardino, Riverside and San Diego counties.

Silver is not generally found alone in the state, except notably in the Rand district, San Bernardino County; but is associated to a greater or less extent with gold, copper, lead and zinc.

Quicksilver has for many years been one of the state's staple products and California has supplied approximately 75% of the nation's output of this metal.

Tungsten is found in but few other localities of importance in the United States.

Large deposits of iron ore have long been known in several sections of the state, but for various economic reasons this branch of the mineral industry thus far has made only slight progress on the Pacific Coast.

Titanium is associated with some of California's iron deposits. This mineral is widely distributed through the United States, but the deposits of this state are among the few that are considered of commercial importance.

Although the United States is a large consumer of certain metals, in fact the largest particularly of chromium and tin, our production from domestic sources is deficient. We have large reserves of low-grade

The curves are not to be considered as permanent records of production. They show merely the current trend in terms of daily output according to the latest estimates of the American Bureau of Metal Statistics. The figures represent production from countries that produce approximately 98 per cent of the world's copper, 97 per cent of the zinc, 90 per cent of the lead, and 88 per cent of the silver. The figures for lead on the new basis are not available for the individual months of 1926, and accordingly a horizontal line showing the monthly average reduced to a daily rate is shown. Delay in receipt of statistics from Mexico accounts for the failure of the silver curve to be up to date.—From *Engineering and Mining Journal*, July 14, 1928.

chromite, manganese, tungsten, and antimony ores, but they can not fully supply our commercial needs.

A comparison of the 1927 output with that of the 1926 is afforded by the following table:

Substance	1926		1927		Increase + Decrease— Value
	Amount	Value	Amount	Value	
Copper.....	33,521,544 lbs.	\$4,693,014	27,350,316 lbs.	\$3,582,885	\$1,110,129—
Gold.....	—	11,923,481	—	11,671,018	252,463—

* Under 'Unapportioned'.

^a Includes iron ore and antimony.

^b Includes antimony, iron ore, tungsten and titanium.

ALUMINUM

Bibliography: Report XVIII, p. 198. Bulletins 38, 67. U. S. Geol. Surv., Min. Res. of U. S.

To date there has been no commercial production of aluminum ore in California. Only a single authenticated occurrence of bauxite has thus far been noted in this state, being in Riverside County, southeast of Corona, but as yet undeveloped.

Minerals containing aluminum are abundant, the most widely distributed being the clays. There are only two, however, thus far of consequence commercially, in the production of the metal: bauxite (to which may be added the related hydrated oxides, hydrargillite and diaspore) and cryolite. Cryolite is found in commercial quantities only in south Greenland, and was formerly the only ore of aluminum used, being still employed as a flux in the extraction of the metal. Bauxite has been, for some years, the most important source of aluminum and its salts. Its color varies from gray to red, according to the amount of iron present, the composition ranging usually between the following limits: Al_2O_3 , 30%–60%; Fe_2O_3 , 3%–25%; SiO_2 , 0.5%–20%; TiO_2 , 0.0%–10%. Besides its reduction to the metal bauxite is also utilized in the manufacture of aluminum salts, refractory bricks, aluminum (fused alumina) for use as an abrasive, and in the refining of oil. The most important producing countries, both of bauxite and the metal, are the United States and France, the former yielding more than 60 per cent of the world's output. In 1913 France led.

ANTIMONY

Bibliography: State Mineralogist Reports VIII, X, XII–XV (inc.), XVII, XXII. Bulletins 38, 91.

Production of antimony in California has been irregular, and small in amount except during 1915–17 when the high war-time prices permitted American producers, for a short period, to compete with Chinese

antimony. The principal commercial production of antimony in California has come from Kern, Inyo and San Benito counties, and other occurrences have been noted in Nevada, Riverside and Santa Clara counties. The commonest occurrence is in the form of the sulphide, stibnite; but in the Kernville and Havilah districts in Kern County there were notable deposits of the native metal, being among the few localities of the world where native antimony has been found. There was a small production reported from San Benito County and development work on properties both in Kern and San Benito counties.

California producers claim that they can not operate profitably unless the price of antimony be above 12 cents per pound. During most of 1925 and 1926 the price was up, at times as high as 23¢, and as a consequence there was some revival of antimony mining in California. Present New York quotations (August, 1928) are around 10¢ per pound for Chinese brands. China is the principal world source of antimony.

The antimony market (New York being the chief center) is recognized as one of the most unstable of the metal markets. As the world's requirements for antimony are comparatively small, the prices react sharply if an extra quantity of the metal be thrown onto the market, and the trade becomes so cautious that the market may disappear altogether, causing production to fall off rapidly.

Pure antimony metal and manufactured antimony compounds are of considerable importance as pigments in the ceramic industry. The most important use of the metal, commercially, is in various alloys, particularly type-metal (with tin and lead), babbitt (with tin and copper), and britannia metal (with tin and copper). An alloy of 6% antimony and 9.4% lead is being extensively used in making battery plates for storage batteries for automobiles, airplanes, and radio apparatus.

Antimony Production of California, by Years.

The production of antimony in California by years since 1887 has been as follows:

Year	Tons	Value	Year	Tons	Value
1887.....	75	\$15,500	1901.....	50	\$8,350
1888.....	100	20,000	1902.....		
1889.....			1915.....	510	35,666
1893.....	50	2,250	1916.....	1,015	64,793
1894.....	150	6,000	1917.....	158	18,786
1895.....	33	1,485	1918.....		
1896.....	17	2,320	1925.....	*26	770
1897.....	20	3,500	1926.....

*Annual details concealed under 'Unapportioned.'

ARSENIC

Bibliography: Report XVIII. Bulletin 67. U. S. G. S., Min. Res. of U. S.

Arsenic is found in a number of localities in California in the mineral arsenopyrite (FeAsS), which is frequently gold bearing; and in scor-

dite ($\text{FeAsO}_4 + 2\text{H}_2\text{O}$), an oxidation product of arsenopyrite. The occurrence of realgar (AsS) has also been noted. The principal source of the arsenic of commerce in the United States has been as a by-product from the metallurgical treatment of copper, gold, and lead ores. It is usually recovered in the form of the tri-oxide, or 'white arsenic,' for which there is a demand for the preparation of insecticides, for use in agriculture and horticulture, and especially against the cotton-boll weevil in the southern states.

Except for a small output in 1924, there has been no commercial recovery of arsenic from Californian ores. There having been only a single operator, the figures are concealed under the 'Unapportioned' item.

BERYLLIUM

Bibliography: Eng. & Min. Jour.-Press, Vol. 118, No. 8, p. 285, Aug. 23, 1924.

Beryllium is a metal resembling aluminum closely in its chemical character, and has a specific gravity of 1.85. Several alloys have been prepared experimentally, of which copper-beryllium has received the most attention. The addition of 5% beryllium produces a golden-yellow alloy. The compounds of beryllium at present used commercially are the nitrate and oxide. The nitrate is used by incandescent mantle manufacturers to harden the thorium oxide skeleton, and the oxide has been added to materials being used for the manufacture of abrasive compounds and in dental cements. Beryllium sulphate has been used to some extent in medical research.

There are a number of beryllium minerals, but none have been found in commercial quantities, except beryl, which is a beryllium-aluminum silicate. The chief use at present for ground beryl is as an addition to porcelain products, where it reduces the coefficient of expansion. Beryllium metal is difficult to separate from aluminum.

Beryl occurs in California in the pegmatite dikes of the tourmaline gem district in northern San Diego and southwestern Riverside counties. Thus far there have been no commercial shipments of beryl except for gem purposes (the pink and aquamarine varieties).

BISMUTH

Bibliography: Bulletins 38, 67, 91. Am. Jour. Sci., 1903, Vol. 16.

Several bismuth minerals have been found in California, notably native bismuth and bismite (the ochre) in the tourmaline gem district in San Diego and Riverside counties, near Pala. Other occurrences of bismuth minerals, including the sulphide, bismuthinite, have been noted in Inyo, Fresno, Nevada, Tuolumne, San Bernardino, and Mono counties, but only in small quantities. The only commercial production recorded was 20 tons valued at \$2,400, in 1904, and credited to Riverside County. Recovery of bismuth from blister copper in the electrolytic refinery has been noted. In the United States, the principal recovery of bismuth is obtained as a by-product from the refining of lead bullion.

The uses of bismuth are somewhat restricted, being employed principally in the preparation of medicinal salts, and in low melting-point

or cliché alloys. These alloys are utilized in automatic fire sprinkler systems, in electrical fuses, and in solders.

Present quotations for bismuth are around \$1.85 per pound for the refined metal.

CADMIUM

Bibliography: U. S. Geol. Surv., Min. Res. of U. S., 1908, 1918.

During 1917 and 1918, cadmium metal was recovered by the electrolytic zinc plant of the Mammoth Copper Company in Shasta County. It was shipped in the form of 'sticks' and amounted to a total of several thousand pounds for the two years, the exact figures being concealed under 'Unapportioned.' That was the first, and thus far the only, commercial production of cadmium recorded from Californian ore. Cadmium occurs there associated with zinc sulphide, sphalerite. Cadmium also occurs in the Cerro Gordo Mine, Inyo County, associated with smithsonite (zinc carbonate).

There are several cadmium minerals, but none of them occur in sufficient quantities individually to be profitable as distinct ores. The cadmium of commerce is derived as a by-product in the reduction of zinc minerals and ores, in nearly all of which it occurs in at least minute proportions, the average ratio being about 1 of cadmium to 200 of zinc. As cadmium behaves metallurgically much the same as zinc, it constitutes a fraction of 1 per cent of nearly all metallic zinc.

Cadmium is produced in the United States in two forms—metallic cadmium and the pigment, cadmium sulphide. The principal use of the metal is in low-melting point, or cliché alloys, and its salts are utilized in the arts, medicine, and in electroplating. The sulphide is employed as a paint pigment, being a strong yellow, which is unaffected by hydrogen sulphide gas from coal smoke. It is also employed in coloring glass and porcelain. Cadmium cliché metal is stated to be superior to the corresponding bismuth alloy, for making stereotype plates. Cadmium is also used in bronze telegraph and telephone wires, and gives some promise of being utilized in electroplating.

Present quotations for cadmium are 80¢ per pound for the refined metal.

COBALT

Bibliography: Report XIV. Bulletins 67, 91. U. S. G. S., Min. Res. of U. S., 1912, 1918

Occurrences of some of the cobalt minerals have been noted in several localities in California, but to date no commercial production has resulted. Some of the copper ores of the foothill copper belt in Mariposa and Madera counties have been found to contain cobalt up to 3%. The most notable occurrence thus far found in this state is in the Mar-John Mine near Sheep Ranch, Calaveras County. Lenses of smaltite (CoAs_2), have been uncovered in the vein, there, and several tons taken out in the course of development work; but as yet there have been no commercial shipments.

The most important use of cobalt is in the manufacture of the alloy, stellite, in which it is combined with chromium, for making high-speed lathe tools, and non-tarnishing cutlery and surgeons' appliances. The metal is also used in electroplating, similarly to nickel; and the oxide,

carbonate, chloride, sulphate and other salts are used in ceramics for coloring. Some of the organic salts of cobalt (acetate, resinate, oleate) are employed as 'driers' in paint and varnish.

The nominal quotation for cobalt is around \$2.10 per pound for the refined metal.

COPPER

Bibliography: State Mineralogist Reports VIII-XXII (inc.).
Bulletins 23, 50, 91.

Copper is second only to gold among the metals mined in California. The output for 1927 amounted to a total of 27,350,316 pounds of recoverable metal valued at \$3,582,888, a decrease from the 1926 figures of 33,521,544 pounds and \$4,693,014. The average price of copper for 1927 was 13.1¢ per pound against 14.0¢ in 1926.

As for several years past, Plumas County ranks first for 1927, with an output of 21,055,425 pounds; Shasta second with 4,524,906 pounds; and Trinity third with 770,882 pounds.

Distribution of the 1927 copper output by counties was as follows:

County	Amount	Value
Calaveras -----	750,909	\$98,367
Inyo -----	30,010	3,931
Plumas -----	21,055,425	2,758,261
Riverside -----	19,201	2,515
San Bernardino -----	197,132	25,824
Shasta -----	4,524,906	592,763
Trinity -----	770,882	100,986
Amador, Butte, El Dorado, Imperial, Kern, Los Angeles, Mono, Napa, Nevada, San Luis Obispo, Sierra*-----	1,851	241
Totals-----	27,350,316	\$3,582,888

* Combined to conceal output of a single operator in each.

Copper Production of the United States.

According to preliminary data issued by the U. S. Bureau of Mines,¹ the smelter production of primary copper from domestic sources during 1927 amounted to 1,684,040,983 pounds, an increase of approximately 3%. The value of smelter production increased approximately 9% in 1926. The average price of 2,836,000,000 pounds of copper delivered during the year, as reported to the Bureau of Mines by selling agencies, was 13.1¢ per pound.

"Refined Copper"

"The total production of new refined copper in 1927 was 2,326,000,000 pounds, an increase of over 3,000,000 pounds over that in 1926.

"Primary and secondary copper produced by regular refining plants and imported, 1926-1927, in pounds:

"Primary:

Domestic: ^a	1926	1927
Electrolytic -----	1,553,041,424	1,520,076,181
Lake -----	172,372,304	195,135,199

^a "The amounts stated in the last column in the table above do not include copper in stock at foreign smelters or in transit from foreign smelters to refineries in the United States."

Copper Production of California by Years.

Although some mining of copper ores in a small way had been done earlier, shipments in appreciable quantities began in 1861 and con-

tinued of importance up to the end of 1867, when a total of 68,631 tons (of 2376 pounds) of high-grade ores, and 847 tons of matte or 'regulus'¹ had been shipped to smelters at New York, Boston, and Swansea, Wales. The most important district at that time was Copperopolis and vicinity in Calaveras County, with some shipments also made from Mariposa, El Dorado, Fresno, and San Luis Obispo counties. From 1868 to 1882, the output was insignificant. There are wide discrepancies in the figures currently recorded for copper production previous to 1882 in which year the data of the U. S. Geological Survey began. The detailed statistics of the California State Mining Bureau began in the year 1894.

Amount and value of copper production in California annually since 1882 is given in the following tabulation:

Year	Pounds	Value	Year	Pounds	Value
1882	826,695	\$144,672	1906	28,726,448	\$5,522,712
1883	1,600,862	265,743	1907	32,602,945	6,341,387
1884	876,166	120,911	1908	40,868,772	5,350,777
1885	469,028	49,248	1909	65,727,736	8,478,142
1886	430,210	43,021	1910	53,721,032	6,680,641
1887	1,600,000	192,000	1911	36,838,024	4,604,753
1888	1,570,021	235,303	1912	34,169,997	5,638,049
1889	151,505	18,180	1913	34,471,118	5,343,023
1890	23,347	3,502	1914	30,491,535	4,055,375

GOLD

Bibliography: State Mineralogist Reports I to XXIII (inc.), (except III and VIII). Bulletins 36, 45, 57, 91, 92, 95. U. S. Geol. Surv., Prof. Paper 73.

Gold was the first, and, for many years, the most important single mineral product of California. Although now surpassed for a number of years in annual value by petroleum, and by cement beginning with 1920, it still heads our metal list, and California continues to outrank all the other gold-producing states of the United States, including Alaska. In fact, at present, California is producing approximately 26% of the gold mined in the entire United States.

While there is some renewal of activity in the development of gold placer properties, it has not yet become reflected in an increased yield of the metal. In fact, the 1927 figures show a decrease from the 1926 values.

The gold yield has decreased in recent years, not only in California but in the country as a whole. Meanwhile, the actual gold reserves (monetary stock on hand) of the United States has increased to such an extent that we now hold practically one-half of the world's stock.

¹ Brown, J. Ross, *Mineral Resources West of the Rocky Mountains*, p. 168, 1867.

The production of gold in California in 1927 totaled 564,585.50 fine ounces, worth \$11,671,018, being a decrease of 12,212.90 fine ounces from the 1926 yield. The 'deep' or lode mines output accounted for \$5,833,705, and the placers (mainly the dredges) produced \$5,837,313. As the Division of Mines and Mining has never independently gathered the statistics of the gold and silver production, these figures, as in former years, are published by cooperation with and through the courtesy of Mr. J. M. Hill of the Division of Minerals and Statistics, U. S. Bureau of Mines.

Distribution of the 1927 gold production, by counties, was as follows:

Gold Production, by Counties, 1927

County	Value	County	Value
Alpine -----	\$146	Napa -----	\$7,235
Amador -----	1,922,714	Nevada -----	2,127,195
Butte -----	143,494	Placer -----	97,494
Calaveras -----	219,217	Plumas -----	321,016
Del Norte -----	384	Riverside -----	1,492
El Dorado -----	82,254	Sacramento -----	1,211,278
Fresno -----	17,406	San Bernardino -----	82,225
Humboldt -----	1,729	San Diego -----	11,490
Imperial -----	257	Shasta -----	191,900
Inyo -----	10,109	Sierra -----	678,873
Kern -----	171,100	Siskiyou -----	138,822
Lassen -----	531	Stanislaus -----	120,238
Los Angeles -----	2,345	Trinity -----	409,492
Madera -----	4,181	Tuolumne -----	40,209
Mariposa -----	183,805	Yuba -----	3,468,201
Mono -----	3,626		
Monterey -----	500	Total value -----	\$11,671,018

The largest gold production for 1927 is reported from Yuba County with an output of 167,774.20 fine ounces (\$3,468,201); Nevada County with 102,903.07 fine ounces (\$2,127,195) second; Amador County with 93,011.27 fine ounces (\$1,922,714) third; Sacramento County with 58,595.57 fine ounces, fourth; followed by Sierra and Trinity counties in fifth and sixth places, respectively. It will be noted as in 1926 Yuba County was the largest gold producer, with Nevada, Amador, and Sacramento following respectively in the same order. The Yuba and Sacramento production came almost entirely from dredges, while that from Nevada and Amador came mainly as lode gold.

The following is quoted from the advance chapter on Gold in 1927, by courtesy of Mr. J. M. Hill of the U. S. Bureau of Mines:

"The value of the mine production of gold in California in 1927 decreased \$252,463, or 2 per cent, as compared with 1926. Lode mines yielded 50 per cent and placer mines 50 per cent of the total gold in 1927, as compared with 56 per cent and 44 per cent in 1926, 61 per cent and 39 per cent in 1925, and 65 per cent and 35 per cent, respectively, in 1924.

"Four counties produced more than \$1,000,000 each in gold in 1927 as compared with four counties in 1926; Sierra County mines did not reach the million mark in gold value in either 1927 or 1926. Yuba, with \$3,468,201, produced largely by dredges, was first in rank; Nevada, with \$2,127,195, largely from gold lode mines, was second; Amador, with \$1,922,714, almost entirely from gold lode mines, was third; and Sacramento, with \$1,211,278, entirely from placers, mostly worked by dredges, was fourth. The fifth largest output of gold, \$678,873, came from Sierra County, largely from gold lode mines, and was followed by Trinity County with \$409,492, largely from dredge and hydraulic placer mines. Calaveras County, which was fifth in rank in 1926, dropped to eighth place in 1927, being preceded by Plumas County in its value of gold.

"The yield of gold from 465 placer mines in 1927 was valued at \$5,837,313, an increase of 12 per cent as compared with the placer output from 483 mines in 1926. There was an increased gold yield of 10 per cent by dredges, 28 per cent by drift mines, 75 per cent by hydraulic, and 16 per cent by surface mines, respectively, as compared with 1926. In 1927 dredges yielded 94 per cent, drift mines 2 per cent, hydraulic mines 2 per cent, and surface workings 2 per cent of the gold from California placer deposits. Production of gold by 25 dredges operating in 1927 was \$5,461,929, as compared with \$4,950,545, by 23 dredges in 1926 and \$4,750,842 by 24 dredges in 1925.

"The output of gold from 318 lode mines in California in 1927 was valued at \$5,833,705, a decrease of 13 per cent as compared with 1926, following declines of 16 per cent in 1926 from 1925 and 7 per cent in 1925 from 1924.

"Gold ore and tailings treated in 1927 yielded 93 per cent, copper ore and tailings yielded 6 per cent, and silver ore and tailings yielded 1 per cent of the total gold from lode mines. Amalgamation mills in 1927 recovered approximately 75 per cent, cyanidation plants 15 per cent, and smelters 10 per cent of the gold lode output of California, as compared with 75 per cent, 17 per cent, and 8 per cent, respectively, in 1926.

"It is estimated that approximately 4 per cent of the gold output from lode mines was stolen and sold by 'high graders' in 1927, a reduction of 2 per cent over each of the two preceding years.

"In 1927 there were 33 companies in the state that produced more than 1000 ounces of gold each, and they contributed 91 per cent of the total gold output of the state. This is a decrease of 1 per cent from the 34 companies that produced more than 1000 ounces each in 1926. Of the 33 larger companies 7 produced more than 20,000 ounces each and 2 more than 50,000 ounces; 11 of them operated 22 gold dredges, 2 drift placer mines, 1 a silver mine, 3 operated copper mines, and 16 operated gold lode mines. The 10 largest gold-producing companies in California in 1927, in order of output, were the Yuba Consolidated Gold Fields (6 dredges), Natomas Company of California (6 dredges), Empire Mines Company (gold lode), Kennedy Mining and Milling Company (gold lode), North Star Mines Company (gold lode), Original Sixteen to One Mine (Inc.) (gold lode), Argonaut Mining Company (gold lode), Central Eureka Mining Company (gold lode), Walker Mining Company (copper mine), and the Original Mining and Milling Company (gold lode)."

Total Gold Production of California.

The presence of gold in stream gravels near Los Angeles was known and worked in a small way by the Indians, at least as early as 1841,¹ and possibly 1820.² On March 2, 1844, Don Manuel Castanares, deputy for California to the Congress of Mexico, reported³ to his government that placers near Los Angeles had produced up to December, 1843, a total of 2000 ounces of gold dust, most of which had been sent to the United States mint at Philadelphia.

As the padres and the rancheros discouraged the quest of gold this early, small production caused no particular excitement. It was not until James W. Marshall's finding of gold nuggets in the tail-race of Sutter's saw mill on the American River, January 24, 1848, was heralded abroad that the great rush began, and California became a common-wealth of first rank almost over night. There are, however, no authentic data on gold production prior to 1848, other than occasional, scattered references such as above quoted.

The following table was originally compiled by Chas. G. Yale, of the Division of Mineral Resources, U. S. Geological Survey, but for a number of years statistician of the California State Mining Bureau and the U. S. Mint at San Francisco. The authorities chosen for certain periods were: J. D. Whitney, state geologist of California; John Arthur Phillips, author of "Mining and Metallurgy of Gold and Silver" (1867); U. S. Mining Commissioner R. W. Raymond; U. S. Mining Commissioner J. Ross Browne; Wm. P. Blake, Commissioner from California to the Paris Exposition, where he made a report on "Precious Metals" (1867); John J. Valentine, author for many years of the annual report on precious metals published by Wells, Fargo & Company's Express; and Louis A. Garnett, in the early days manager of the San Francisco refinery, where records of gold receipts and shipments were kept. Mr. Yale obtained other data from the reports of the director of the U. S. Mint and the director of the U. S. Geological Survey. The authorities referred to, who were alive at the time of the original compilation of this table in 1894, were all consulted in person or by letter by Mr. Yale with reference to the correctness of their published data, and the final table quoted was then made up.

IRIDIUM (see under Platinum)

IRON ORE

Bibliography: State Mineralogist Reports II, IV, V, X, XII-XV (inc.), XVII, XVIII, XXI, XXII, XXIII. Bulletins 38, 67, 91. Am. Inst. Min. Eng., Trans. LIII. Min. & Sci. Press, Vol. 115, pp. 112, 117-122; Vol. 123, pp. 94-96, 113-114.

A small tonnage of iron ore (magnetite) was produced in California during the year 1927, from beach sand, and utilized for foundry flux and in steel refining at open-hearth plants. As there was only a single operator, the figures are concealed under the 'unapportioned' total. There is also some tonnage utilized in the manufacture of paint pigment, and which is credited to 'mineral paint' in these statistical reports.

There are considerable deposits of iron ore known in California, notably in Shasta, Madera, Placer, Riverside, San Bernardino and Los Angeles counties, but production has so far been limited for lack of an economic supply of coking coal. Some pig-iron has been made, utilizing charcoal for fuel, both in blast furnaces and by electrical reduction; also, ferrochrome, ferromanganese, and ferrosilicon have been made in California.

Total Iron Ore Production of California.

Total iron ore production in California, with annual amounts and values, is as follows:

Year	Tons	Value	Year	Tons	Value
1881*.....	9,273	\$79,452	1914.....	1,436	\$5,128
1882.....	2,073	17,766	1915.....	724	2,584
1883.....	11,191	106,540	1916.....	3,000	6,000
1884.....	4,532	40,983	1917.....	2,874	11,496
1885.....			1918.....	3,108	15,947
1886.....	3,676	19,250	1919.....	2,300	13,796
1887.....			1920.....	5,975	40,889
1893.....	250	2,000	1921.....	1,970	12,030
1894.....	200	1,500	1922.....	3,588	18,868

1908.....			1925 ^a		
1909.....	108	174	1926 ^a	5,272	26,000
1910.....	579	900	1927 ^a		
1911.....	558	558			
1912.....	2,508	2,508	Totals.....	71,805	\$552,629
1913.....	2,343	4,485			

*Productions for the year 1881-1886 (inc.) were reported as "tons of pig iron" (U. S. G. S., Min. Res. 1885), and for the table herewith are calculated to "tons of ore" on the basis of 47.6% Fe as shown by an average of analyses of the ores (State Mineralogist Report IV, p. 242). This early production of pig iron was from the blast furnaces then in operation at Hotelling in Placer County. Charcoal was used in lieu of coke. Though producing a superior grade of metal, they were obliged finally to close down, as they could not compete with the cheaper English and eastern United States iron brought in by sea to San Francisco.

^a Annual details concealed under 'Unapportioned.'

LEAD**Bibliography:** State Mineralogist Reports IV, VIII-XV (inc.), XVII-XXII (inc.).

The production of lead in California in 1927 was 2,748,440 pounds of recoverable metal valued at \$173,235, as against the production of 1926 of 8,067,873 pounds valued at \$645,429. The average price of lead in 1927 was 6.3¢ a pound against 8.0¢ in 1926 and 8.7¢ in 1925.

As in the past the principal output of lead was from the lead-silver ores of Inyo County.

Lead Production by Counties for 1927

County	Pounds	Value
Amador.....	2,491	\$157
Calaveras.....	4,606	290
Inyo.....	2,173,032	136,901
Los Angeles.....	312,645	19,697
Mono.....	4,830	304
Riverside.....	121,667	7,665
San Bernardino.....	125,692	7,919
Shasta.....	1,780	112
Butte, Nevada, Plumas*.....	1,691	106
Totals.....	2,748,440	\$173,151

* Combined to conceal output of a single operator in each.

In 1927 the production of primary lead in the United States was 668,320 short tons valued at \$84,210,000, as shown by report of the United States Bureau of Mines,¹ this being a decline from the national production of 1926 of 680,685 short tons valued at \$108,910,000, due to a decline in the average selling price of lead from 8.0¢ to 6.7¢.

¹ U. S. Bureau of Mines, Mineral Resources of the United States (Preliminary Summary).

From *Engineering and Mining Journal*, July 14, 1928.

Lead Production of California, by Years.

Statistics on lead production in California were first compiled by this Bureau in 1887. Amount and value of the output, annually, with total figures, to date, are given in the following table:

Year	Pounds	Value	Year	Pounds	Value
1887.....	1,160,000	\$52,200	1909.....	2,685,477	\$144,897
1888.....	900,000	38,250	1910.....	3,016,902	134,082
1889.....	940,000	35,720	1911.....	1,403,839	63,173

MANGANESE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVIII, XXII. Bulletins 38, 67, 76, 91. U. S. G. S., Bull. 427. Eng. & Min. Jour.-Press, Vol. 117, p. 545.

Small amounts of manganese ore from California have been shipped in past years to steel plants along the Pacific Coast. These ores showed analyses of from 45% to 55% Mn and were utilized by plants for ferromanganese.

Importations of foreign manganese ores to the United States in 1927, mainly from Brazil, amounted to a total of 622,067 long tons valued at \$4,87,016, compared with 368,341 tons and \$11,075,771 in 1926. The Tariff Act of 1922 provides for an import duty of 1¢ per pound on the metallic manganese contained, for "manganese ore or concen-

trates containing in excess of 30 per centum of metallic manganese." The bulk of such ore is consumed in the large steel-producing centers of the eastern United States.

Much valuable research work has been done in recent years, particularly by companies operating in Montana and Virginia, in the beneficiation of manganese ores. The success of their processes appears assured. In reply to the recent suggestion of certain steel interests to have the manganese import duty removed, the manganese operators have organized the American Manganese Producers' Association, which will work for retention of the tariff. Such retention will enable the domestic industry to grow and to further develop ore-dressing methods that will make available large tonnages of low-grade material not now marketable.

Manganese Ore Production in California, by Years.

Production of manganese ore in California began at the Ladd Mine, San Joaquin County, in the Tesla District in 1867. When shipments of this ore to England ceased late in 1874, upwards of 5000 tons had been produced by that property. For some years following that, the output was small. The tabulation herewith shows California's output of manganese ore, annually, since 1887, when the compilation of such figures was begun by the State Mining Bureau:

Year	Tons	Value	Year	Tons	Value
1887.....	1,000	\$9,000	1909.....	3	\$75
1888.....	1,500	13,500	1910.....	265	4,235
1889.....	53	901	1911.....	2	40
1890.....	386	3,176	1912.....	22	400
1891.....	705	3,830	1913.....

MOLYBDENUM

Bibliography: State Mineralogist Reports XIV, XVII. Bulletins 67, 91. U. S. Bur. of Min., Bulletin 111. Proc. Colo. Sci. Soc., Vol. XI.

Molybdenum is used as an alloy constituent in the steel industry, and in certain forms of electrical apparatus. Included in the latter is its successful substitution for platinum and platinum-iridium in electric contact-making and -breaking devices. In alloys it is used similarly to and in conjunction with chromium, cobalt, iron, manganese, nickel, tungsten, and vanadium. The oxides and the ammonium salt have important chemical uses.

The two principal molybdenum minerals are: the sulphide, molybdenite; and wulfenite, lead molybdate; the former furnishing practically the entire commercial output. Molybdenite is found in or associated with acidic igneous rocks, such as granite and pegmatite. The chief commercial sources have been New South Wales, Queensland and Norway, with some also from Canada; but the United States is now able to supply its own requirements.

The growing consumption of molybdenum by alloy-steel makers in the United States has been stimulated by the fact that molybdenum alone of the steel-alloying metals can be produced commercially in the United States to an extent which avoids all necessity for importation. Another fact has been the marked adaptability of molybdenum steels to large-scale production of automobile and other parts.

The most important development of 1924-1925 was the elimination of ferromolybdenum from the market due to the substitution of calcium molybdate as the furnace addition by the entire alloy-steel industry. Calcium molybdate is stated to be not only easier and less costly to prepare, but it introduces the molybdenum into the steel bath in a much purer form, the resulting steel being superior to that made with ferromolybdenum.

Deposits of disseminated molybdenite are known in several localities in California, and in at least two places it occurs in small masses associated with copper sulphides. The only recorded commercial shipments of molybdenum ore in California were during the war, 1916-1918. Some development work has been recently done on a high-grade deposit at the head of the Kaweah River, Tulare County.

The present quotations on ferromolybdenum are \$1.20 per pound Mo f. o. b. shipping point 50%—60% Mo.

Molybdenum Production of California, by Years.

California's production of molybdenum ore by years is summarized in the following tabulation:

Year	Tons	Value
1916	8	\$9,945
1917	243	9,014
1918	*	300
Totals	251	\$19,259

* 300 pounds of 90% MoS_2 concentrate.

NICKEL

Bibliography: State Mineralogist Reports XIV, XVII, U. S. G. S., Bulletin 640-D. U. S. Bureau of Standards, Circular 100.

Nickel occurs in the Friday Copper Mine in the Julian District, San Diego County. The ore is a nickel-bearing pyrrhotite, with some associated chalcopyrite. Some ore has been mined in the course of development work, but not treated nor disposed of, as they were unable to get any smelter to handle it for them. Nickel ore has also been reported from other localities in California, but not yet confirmed.

Present quotations for nickel are around 35¢-37¢ per pound for the refined metal.

OSMIUM (see under Platinum)

PALLADIUM (see under Platinum)

PLATINUM

Bibliography: State Mineralogist Reports IV, VIII, IX, XII-VIII. Bulletins 38, 45, 67, 85, 91, 92. U. S. Geol. Surv. Bulletins 193, 285. Trans. Am. Ins. Min. Eng., Vol. 47, pp. 217-218.

In California the platinum group metals are obtained as a by-product from placer operations for gold. The major portion of it comes from the dredges working in Butte, Sacramento, Stanislaus and Shasta counties, with a small amount coming from the hydraulic and surface-sluicing mines of Del Norte, Humboldt, Siskiyou, and Trinity counties.

The production of platinum metals in California for 1927 totaled 183 ounces crude, containing 139 fine ounces valued at \$10,757, compared with the 1926 figures of 322 fine ounces and \$32,005. Of this amount 102 fine ounces or 73% came from the gold dredges.

In addition to the above metal there was some platinum mined but not sold in 1927 in Butte, Trinity and Yuba counties.

Of the above 183 fine ounces at least 37 fine ounces were iridium, osmium, palladium and ruthenium. Most of the platinum refiners pay for the osmiridium on the basis of its iridium content. Crude 'platinum' is really a mixture of the metals of that group, and carries varying percentages of platinum, iridium, osmiridium or iridosmine, with occasionally some ruthenium and palladium. In addition to the above-noted production, there is usually some platinum recovered as a by-product in the gold refinery of the mint, but which can not be assigned to the territory of its origin for lack of knowing to which lots of gold it belongs. Some platinum and palladium are also recovered in the electrolytic refining of blister copper.

For 1926, the distribution by counties of California's platinum yield was as follows:

County	Fine ounces	Value
Butte ^a -----	7	\$499
Shasta ^a -----	26	2,552
Siskiyou -----	9	690
Del Norte, Humboldt, Sacramento, ^b Stanislaus, ^a and Trinity* -----	97	7,018
Totals -----	139	\$10,749

* Combined to conceal output of a single operator in each.

^a Includes iridium and osmium.

^b Includes iridium, osmium, palladium and ruthenium.

Uses, Markets, and Consumption.

Besides its well-known uses in jewelry, dentistry and for chemical-ware, an important industrial development of recent years employs platinum as a catalyzer in the 'contact process' of manufacturing concentrated sulphuric acid. It is also necessary for certain delicate parts of the ignition systems in automobiles, motor boats and aeroplanes. Experiments have been made to find alloys which can replace platinum for dishes and crucibles in analytical work, but so far with only slight success.

According to Hill,¹ the total consumption of platinum metals in the United States in 1927 was 149,686 troy ounces, a decrease from that consumed in 1926, distributed as follows:

¹ Hill, J. M., Platinum and Allied Metals in 1927; U. S. Bur. of Mines, Bull., June 2, 1928.

"Platinum metals consumed in the United States as reported by refiners, 1926 and 1927, by industries, in troy ounces:

	Platinum	Iridium	Palladium	Others	Total	Per-centage of total
1926						
Chemical -----	10,253	145	213	228	10,839	6

1927 -----	68,757	4,617	24,313	4,369	102,056

Prices.

The prices of all the metals of the platinum group fluctuated considerably during 1927, dropping in June, when they reached their low point. The price of pure platinum per fine ounce was \$105 in January, 1927, dropping to \$62 in June and ending the year at \$72. Palladium ended the year at \$49 to \$50, iridium at \$175 to \$185. In April there was a rumor that Russian platinum would be sold through Amtorg Company, which sent the market price down. There were also large shipments from Colombia.

Platinum Production of California, by Years.

The annual production and values since 1887, have been as follows:

Year	Ounces	Value	Year	Ounces	Value
1887 -----	100	\$400	1909 -----	416	\$10,400
1888 -----	500	2,000	1910 -----	337	8,386
1889 -----	500	2,000	1911 -----	511	14,873

QUICKSILVER

Bibliography: State Mineralogist Reports IV, V, XII-XV, XVII-XXII (inc.). Bulletins 27, 78, 91. U. S. Geol. Surv., Monograph XIII. U. S. Bur. of Mines, Tech. Papers 96, 227; Bulletin 222.

The production of quicksilver for 1927 in California was 6488 flasks (of 75 pounds, avoirdupois) valued at \$714,418. This was an increase in both quantity and value over the 1926 figure of 5892 flasks valued at \$516,382. This production came from Lake, Monterey, Napa, Orange, San Benito, San Luis Obispo and Sonoma counties, the largest production coming from San Benito, with Napa in second place. The average price received during 1927, according to the producers'

New Idria Mine at Idria, San Benito County. This mine is the largest quicksilver producer in the United States. Photo by Walter W. Bradley.

reports to the Division of Mines and Mining, was \$111.67 per flask, as against \$89.64 in 1926, and the record average of \$114.03 for the year 1918.

During 1927 there were sharp fluctuations of quotations on quicksilver. The year started at \$100.33, going to \$123.33 in April, and ending the year at \$129.50. In June the price quoted changed from a 75-pound flask to a 76-pound flask.

The average quotations for quicksilver in 1927 were \$117.25 for a 76-pound flask at San Francisco, or \$115.71 (for 75 pounds), against \$87.64 (75 pounds) in 1926. The average quotations for 1927 in New York were \$118.16 for a 76-pound flask, or \$116.60 for a 75-pound flask.

The U. S. Bureau of Mines reported the total production of the United States for 1927 at 11,276 flasks valued at \$1,314,782 (using \$116.60 as the average of New York quotations). Outside of California, the principal yield came from Texas and Washington, with a few flasks from Nevada, Alaska, Arizona, and Idaho. California production was approximately 53% of the total.

The imported quicksilver¹ in 1927 amounted to 24,650 flasks. Of these, 13,663 flasks came from Spain, 9089 flasks from Italy, and 1843 flasks from Mexico. The rise in price in the last quarter of 1926 and 1927 was due to an increased demand in the United States, as shown by the increased production and imports and the continued demand of continental Europe.

Uses.

The most important uses of quicksilver are the recovery of gold and silver by amalgamation, and in the manufacture of fulminate for explosive caps, of drugs, of electric appliances, and of scientific apparatus. By far the greatest consumption is in the manufacture of fulminate and drugs. Radio tubes and electrical appliances are taking increasing amounts.

Total Quicksilver Production of California.

* Flasks of 75 lbs. since June, 1904; of 76½ lbs. previously.

¹ C. S. Dept. of Comm. Press Bull., May 29, 1928.

Total amount and value of the quicksilver production of California, as given in available records, are shown in the preceding tabulation. Though the New Almaden Mine in Santa Clara County was first worked in 1824, and has been in practically continuous operation since 1846 (the yield being small the first two years), there are no available data on the output earlier than 1850. Previous to June, 1904, a 'flask' of quicksilver contained 76½ pounds, but since that date 75 pounds. In compiling this table the following sources of information were used: for 1850-1883, table by J. B. Randol, in Report of State Mineralogist, IV, p. 336; 1883-1893, U. S. Geological Survey reports; 1894 to date, statistical bulletins of the State Mining Bureau; also State Mining Bureau, Bulletin 27, "Quicksilver Resources of California," 1908, p. 10.

SILVER

Bibliography: State Mineralogist Reports IV, VIII, XII-XXIII (inc.). Bulletins 67, 91. Min. & Sci. Press, March 1, 1919.

Except for the early-day production from the silver mines of the Calico district and the more recent production from those of the Randsburg area, both of which are in San Bernardino County, the recovery of silver in California has been largely as a by-product from its association with copper, lead, zinc, and gold ores.

In 1927 silver production of California totaled 1,620,242 fine ounces valued at \$918,677, compared with 2,022,460 ounces values at \$1,262,-015 in 1926. Of the 1927 yield 20,903 ounces valued at \$11,852 came from placers. The average price of domestic silver during 1927 was 56.7¢ per ounce in New York against 62.4¢ in 1926.

The figures below are those of the U. S. Bureau of Mines, Department of Commerce (as explained under Gold).

The distribution of the 1927 silver yield, by counties, was as follows:

Silver Production by Counties		
County	Fine ounces	Value
Alpine	105	\$60
Amador	19,963	11,319
Butte	655	371
Calaveras	7,023	3,982
Del Norte	2	1
El Dorado	675	383
Fresno	136	77
Humboldt	25	14
Imperial	5	3
Inyo	83,570	47,384
Kern	15,753	8,932
Lassen	16	9
Los Angeles	26,135	14,819
Madera	67	38
Mariposa	2,427	1,376
Mono	38,487	21,822
Monterey	4	2
Napa	99,532	56,435
Nevada	48,644	27,581
Placer	776	440
Plumas	315,887	179,108
Riverside	3,385	1,919
Sacramento	2,596	1,472
San Bernardino	788,580	447,125
San Diego	162	82
Shasta	123,917	70,261
Sierra	5,909	3,350
Siskiyou	1,033	586
Stanislaus	608	345
Trinity	21,739	12,326
Tuolumne	533	302
Yuba	11,893	6,743
Totals	1,620,242	\$918,677

The following paragraphs are quoted from the U. S. Bureau of Mines, Department of Commerce, Advance Chapter on Gold and Silver for 1927, by courtesy of Mr. J. M. Hill, statistician in charge of the San Francisco branch office:

"The mine production of silver in California in 1927 was 1,620,242 ounces, valued at \$918,677, a decrease of 20 per cent in quantity and 27 per cent in value as compared with 1926. Three counties yielded more than 100,000 ounces of silver each in 1927, namely, San Bernardino County, with 788,580 ounces largely from silver ore produced by the California Rand Silver (Inc.); Plumas County, with 315,887 ounces, largely from copper ores of the Engels and Walker mines; Shasta County, with 123,917 ounces, largely from zinc and copper ores. Inyo and Mono counties were in the 100,000 ounce class in 1926, but each produced less than 100,000 ounces in 1927. The fourth largest producer of silver was Napa County, with 99,532 ounces from silver ores, and this was followed by Inyo County, with 83,570 ounces, mostly from lead ores.

"The yield of silver from placer mines in 1927 was 20,903 ounces, 8 per cent more than in 1926 and over 1 per cent of the total silver output of the state. Of the 1,599,339 ounces of silver produced at lode mines in 1927 silver ore and tailings yielded 58 per cent (same as in 1926), copper ore and tailings 25 per cent (20 per

From *Engineering and Mining Journal*, July 14, 1928.

cent in 1926), gold ore and tailings 6 per cent (5 per cent in 1926), lead ore and tailings 5 per cent (6 per cent in 1926), zinc ore 4 per cent (7 per cent in 1926), lead-zinc ore 2 per cent, and lead-copper ore less than one-fourth of 1 per cent.

"Each of 43 properties in 1927 produced more than 1000 ounces of silver as compared with 46 properties in 1926, and these mines yielded 98 per cent of the total silver produced in the state in both 1927 and 1926. At 27 properties the yield was between 1000 and 10,000 ounces (31 in 1926), at 13 between 10,000 and 100,000 (10 in 1926), at 2 between 100,000 and 300,000 (4 in 1926), and at 1 mine in excess of 300,000 ounces in 1927. No mine in California produced as much as 1,000,000 ounces of silver in 1927. The 10 largest producers of silver in California in 1927 in order of output were the California Rand Silver (Inc.), Walker Mining Company, Engels Copper Mining Company, Palisades Mines Company, California Zinc Company, Mason Mining Company (Balaklala), Mono Mining Company of Nevada, American Metals (Inc.) (Darwin), North Star Mines Company, and the Santa Catalina Island Company."

Silver Production of California, by Years.

The amount and value of the silver production of California, and the average price, annually, since 1880 are given in the table following. In the table shown in the statistical bulletins previous to Bulletin 97

(for 1925), the values shown for 1880-1904 (inc.) were taken from the reports of the Director of the Mint, of which the figures for 1880-1896 (inc.) were based on 'coinage value' (\$1.2929 per fine ounce). We have recalculated these to commercial value, using the price table of the U. S. Geological Survey (McCaskey, H. D., Gold and Silver, 1913: Mineral Resources of the U. S., Part I, p. 847). From 1905 to date, the figures are those of the U. S. Geological Survey and its successor, the U. S. Bureau of Mines:

Year	Fine oz.	Value	Average price per oz.	Year	Fine oz.	Value	Average price per oz.
1880	882,169	\$1,014,494	\$1 15	1905	1,076,174	\$550,009	\$0 61
1881	580,091	655,503	1 13	1906	1,220,641	817,830	68
1882	653,569	745,069	1 14	1907	1,138,856	751,646	66

TIN

Bibliography: Reports XV, XVII, XVIII. Bulletins 67, 91.

In 1927 there was no production of tin, although there is considerable work being done to reopen the Temescal mine in Riverside County near Corona. There was an output from the district during 1891-1892 as tabulated below. Small quantities of stream tin have been found in some of the placer workings in northern California, but never in paying amounts.

Two occurrences have also been noted, in northern San Diego County. Crystals of cassiterite were found there, associated with blue tourmaline crystals, amblygonite and beryl. No commercial quantity has been developed, only small pockets have been taken out.

The principal sources of the world's supply of tin are the islands of Banka, Billiton and Singkep, Netherlands India (Dutch East Indies), followed by the Federated Malay States (Perak, Pahang, Negri Sembilan and Selangor). Bolivia, Siam, Cornwall, Transvaal, New South Wales, Queensland and Tasmania are also important sources. A measureable amount of the metal is also recovered by detinning scrap and old cans.

Total Output of Tin in California

Year	Pounds	Value
1891	125,289	\$27,564
1892	126,000	32,400
Totals	251,289	\$59,964

TITANIUM*Bibliography:* State Mineralogist's Report XXIII.

In 1927 for the first time titanium minerals were mined in California. These operations were in Los Angeles County, where one of the largest deposits of titanium ore in the United States is located. There were two separate operations, one worked the black beach sands, which probably contained approximately 20% titaniferous iron and magnetite, the gangue being silica and several silicates. The other is a lode deposit in the San Gabriel Mountains.

Titanium is widely distributed in a variety of minerals, but its commercial sources are limited to three forms, rutile (oxide), ilmenite (titanite), and titaniferous magnetite (iron ore rich in titanium). There are several known areas where large deposits of these minerals are found in America, mostly titaniferous iron. Of the titaniferous iron deposits only a portion of the Adirondack deposit, some small deposits in North and South Carolina, and those in Los Angeles County are capable of being separated into a high-grade ilmenite and a low titanium magnetite.

The metal is used in several different alloys with iron, copper and aluminum and for green and white paint pigments, the only colors of titanium pigments now in common use. It is also used in dyes, rubber, as a porcelain glaze, in glass, and cement made from high-titanium iron slags. This cement is resistant to the action of acids.

The market price of titanium minerals varies as to the titanium oxide it contains. Rutile 96% TiO @ 11¢ to 13¢ a pound, ilmenite 52 to 60% TiO @ \$10 to \$15 a ton, and ilmenite 32 to 35% TiO @ \$7 to \$8 a ton, all prices Atlantic seaboard.

TUNGSTEN

Bibliography: Reports XV, XVII, XVIII, XXII. Bulletins 38, 67, 91, 95. U. S. G. S. Bull. 652. Proc. Colo. Sci. Soc. Vol. XI. South Dakota School of Mines, Bulletin No. 12. Eng. and Min. Jour.-Press, Vol. 113, pp. 666-669, Apr. 22, 1922.

The commercial production of tungsten ores and concentrates in California began in 1905; and has been continuous since, with the exception of 1920-1922 (inclusive), when the mines were shut down owing to low prices due to excess stocks following the war and to lack of tariff protection against foreign importations. Production was resumed on a small scale late in 1923, and is now at practically its pre-war average annual tonnage, though the 1927 figures are less than those for 1926.

The material shipped in 1927 included both high-grade sorted ore and concentrates, coming from a property in San Bernardino County. Prices during 1927 ranged from \$10.25 to \$11.75 per unit, duty paid, for Chinese wolframite, with domestic scheelite \$10 to \$11. Present prices are approximately the same.

Tungsten ore has been produced in California principally in the Atolia-Randsburg district in San Bernardino and Kern counties, followed by the Bishop district in Inyo County, with small amounts coming from Nevada County and from the district near Goffs, in eastern San Bernardino. Most of the California tungsten ore is scheelite (cal-

cium tungstate), though wolframite (iron-manganese tungstate) and hübnerite (manganese tungstate) also occur. The deposits at Atolia are the largest and most productive scheelite deposits known,¹ and the output has in some years equaled or exceeded that of ferberite (iron tungstate) from Boulder County, Colorado. It is interesting in this connection to note that, in practically all other tungsten producing districts of the world, wolframite is the important constituent.

Imports of foreign tungsten ore and alloys into the United States during 1927 amounted to 1,613,616 pounds valued at \$308,106, compared with 3,441,975 pounds valued at \$871,294 in 1926, and 10,362 long tons of ore valued at \$11,409,237 in 1918, which ores were duty free up to September 22, 1922. Owing to lack of protection against the cheap coolie labor of Asiatic tungsten mines, and low market prices, practically all of the tungsten mines in the United States were closed down from the middle of 1919 to the latter part of 1923. Quotations during 1922 ranged around \$2.50 per unit, up to September. The Tariff Act of 1922 placed a duty on tungsten ore or concentrates of 45¢ per pound on the metallic tungsten contained therein. Duties are also provided for imported tungsten-bearing alloys. Most of the imported ore is coming from China, with smaller amounts from Malaya and Bolivia.

Uses.

The metal, tungsten, is used mainly in the steel industry and in the manufacture of electrical appliances, including the well-known tungsten filament lamps. Because of its resistance to corrosion by acids, it is valuable in making certain forms of chemical apparatus. Its employment in tool-steel alloys permits the operation of cutting tools, such as in lathe work, at a speed and temperature at which carbon steel would lose its temper—hence the name 'high speed' steels for these tungsten alloys. As made in the United States, tungsten forms 13% to 20% of such steels. Some chromium, nickel, cobalt, or vanadium are sometimes also included. Tungsten compounds are used in the manufacture of colors. The indicated consumption is approximately 5000 tons of 60% concentrates per year, in the United States.

Tungsten is introduced into the molten steel charge, either as the powdered metal or as ferro-tungsten (containing 50%–85% tungsten). The specific gravity of the pure metal, 19.3–21.4, is exceeded only by platinum, 21.5; iridium, 22.4; and osmium, 22.5. Its melting point is 3267° C. (5913° F.), being higher than any other known metal. Though millions of tungsten filament lamps are now made, the wires are so fine that the metal they contain represents but a few tons of tungsten concentrates annually.

Total Tungsten Ore Production of California.

The annual amount and value of tungsten ores and concentrates produced in California since the inception of the industry is given herewith, with tonnages recalculated to 60% WO₃:

¹ U. S. G. S. Bull. 652, p. 32.

VANADIUM

Bibliography: Report XV. Bulletins 67, 91. Proc. Colo. Sci. Soc., Vol. XI. U. S. Bur. of Mines, Bulletin 104.

No commercial production of vanadium has yet been made in California. Occurrences of this metal have been found at Camp Signal, near Goffs, in San Bernardino County, and two companies at one time did considerable development work in the endeavor to open up paying quantities. Each had a mill under construction in 1916, but apparently no commercial output was made. Ore carrying the mineral cuprodesloizite and reported as assaying 4% V₂O₅ was opened up. Some ore carrying lead vanadate has been developed in the 29 Palms, or Washington district, on the line between Riverside and San Bernardino counties, but no shipments reported.

The principal use of vanadium is as an alloy in steels, especially in tool steel, and in those varieties where resistance to repeated strains is required. Present New York quotations for ferrovanadium are, per pound of vanadium, f. o. b. works, \$3.15-\$3.65, depending on the grade.

ZINC

Bibliography: State Mineralogist Reports XIV, XV, XVII, XVIII, XX, XXII, XXIII. Bulletins 38, 67, 91.

The recoverable zinc mined in California in 1927 amounted to 8,625,004 pounds valued at \$552,000 compared with 20,447,559 pounds and \$1,533,568 in 1926. This production came from Shasta, Los Angeles (Santa Catalina Island) and Riverside counties and was shipped in the form of concentrates and sinter to Belgium, though a small amount is used in the manufacture of oxide.

The average price per pound quoted for the metal in 1927 was 6.4¢ as against 7.5¢ in 1926.

The zinc ores of Shasta and Calaveras counties are associated with copper, while those of Inyo, Los Angeles and San Bernardino are associated principally with lead-silver and zinc-silver ores.

The principal uses of zinc are for 'galvanizing' (plating on iron to prevent rust), for zinc oxide (used in rubber goods and paint), and for brass (an alloy of copper and zinc). These outlets for the metal take approximately 80% of the quantity produced. Of the remaining 20%

a large portion is rolled into plates and sheets, and utilized in the building industry for sheathing, roofing, leaders, and eaves-troughs. Zinc is particularly desirable and efficient for roofing and siding where corrosive gases are present, as at smelters, refineries and chemical plants.

Zinc Production of the United States.

The production of slab zinc¹ at reduction plants in the United States in 1927 amounted to 576,960 short tons valued at \$73,966,000, not including 15,556 tons of primary metal made from foreign ores, mostly from Mexico, and reduced in refineries in this country. The 1927 production was a decline from that of 1926 of 82,261 tons.

From *Engineering and Mining Journal*, July 14, 1928.

Total Zinc Production of California.

Total figures for zinc output of the state are as follows, commercial production dating back only to 1906:

Year	Pounds	Value	Year	Pounds	Value
1906	206,000	\$12,566	1918	5,565,561	\$506,466

CHAPTER FOUR

STRUCTURAL MATERIALS

Bibliography: State Mineralogist Reports XII-XXIII (inc.). Bulletin 38. Spurr and Wormser, "Marketing of Metals and Minerals." "Non-Metallic Minerals," by R. B. Ladoo. See also under each substance.

As indicated by this subdivision heading, the mineral substances herein considered are those more or less directly used in building and structural work. California is independent, so far as these are concerned, and almost any reasonable construction can be made with materials produced in the state. This branch of the mineral industry for 1927 was valued at \$54,861,649 as compared with a total value of \$54,250,571 for the year 1926, the increase being due to cement, granite and sandstone in spite of a considerable decrease in miscellaneous stone, brick, and magnesite.

Deposits of granite, marble and other building stones are distributed widely throughout this state, and transportation and other facilities are gradually being extended so that the growing demand may be met. The largest single item, cement, has had an interesting record of growth since the inception of the industry in California about 1891. Not until 1904 did the annual value of cement produced reach the million-dollar mark, following which it increased 500% in nine years; though from 1914 to 1918 there was a falling off common to all building materials. The 1927 output established a new record both in quantity and total value, exceeding the previous total value record made in 1923 by over a million dollars.

Crushed rock production is yearly becoming more worthy of consideration, due to the strides taken in the use of concrete, as well as to activity in the building of good roads. Brick, with an average annual output for a number of years worth approximately \$2,000,000, had difficulty in holding its own, due to the popularity of cement and concrete. In 1920, however, the sales increased to nearly double the previous record figure of the year 1907, and in 1923 showed advances to new figures, with a slight recession in 1924-1927. This item will, no doubt, continue to be an important one, and a market for fire and fancy brick of all kinds will unquestionably never be lacking.

All fifty-eight counties contributed to this structural total for 1926. There is not a county in the state which is not capable of some output of at least one of the materials under this classification.

During 1927 building construction on the Pacific coast¹ has declined in the large cities and increased in the smaller towns. The twenty principal cities show a falling off of 20 per cent in the total of building permits.

The following summary shows the value of the structural materials produced in California during the years 1926-1927, with increases or decreases in each instance.

¹ Pacific Coast Letter, Amer. Trust Co., Sept., 1927.

ASPHALT

Bibliography: State Mineralogist Reports VII, X, XII–XV (inc.), XVII, XVIII. Bulletins 16, 32, 63, 67, 69, 91.

Asphalt was for a number of years accounted for in the statistical reports by the State Mining Bureau, because in the early days of the oil industry, considerable asphalt was produced from outcroppings of oil sand, and was a separate industry from the production of oil itself. However, at the present time most of the asphalt comes from the oil refineries, which produce a better and more uniform grade; hence, its value is not now included in the mineral total, as to do so would be in part a duplication of the crude petroleum figures. Such natural asphalt as is at present mined is in the form of bituminous sandstones, and is recorded under that designation.

BITUMINOUS ROCK

Bibliography: State Mineralogist Reports XII, XIII, XV, XVII, XVIII, XXI, XXII.

This material is essentially an uncemented sandstone which is saturated with and held together by a natural asphaltic constituent, probably the residue from the evaporation of a crude petroleum deposit. Bituminous rock is still used to a limited extent for road dressing in those districts adjacent to available deposits, though the manufacture of asphalt at the oil refineries has almost entirely superseded the direct use of the native material. The present operators of the quarry near the old City Street Improvement Company's property in Santa Cruz County advise that they are now putting on the market a material which can be laid cold. It will be especially applicable and valuable for patching jobs.

Shipments from quarries in Santa Barbara and Santa Cruz counties in 1927 totaled 3515 tons of bituminous rock, valued at \$17,704 f. o b. rail-shipping point.

Bituminous Rock Production of California, by Years.

The following tabulation shows the total amount and value of bituminous rock quarried and sold in California, from the records compiled by the State Mining Bureau, annually since 1887:

Year	Tons	Value	Year	Tons	Value
1887	36,000	\$160,000	1909	34,123	\$116,436
1888	50,000	257,000	1910	87,547	165,711
1889	40,000	170,000	1911	75,125	117,279
1890	40,000	170,000	1912	44,073	87,467
1891	39,962	154,164	1913	37,511	78,479
1892	24,000	72,000	1914	66,119	166,618

BRICK AND HOLLOW TILE

Bibliography: State Mineralogist Reports VIII, X, XII-XV (inc.), XVII-XXIII (inc.). Bulletins 38, 99. Preliminary Report, No. 7. Cal. Jour. of Development, June, 1925, pp. 5-6.

Bricks of many varieties and in important quantities are annually produced in California, as might be expected in a state with such diversified and widespread mineral resources. The varieties include common, fire, pressed, glazed, enamel, fancy, vitrified, sand-lime, and others. Not only do the plants here supply practically all of our own requirements in these products, but considerable quantities are shipped to contiguous territory and certain products are shipped over a much wider radius. So far as possible, the different kinds have been segregated in the tabulation herewith accompanying.

We also include under this heading the various forms of hollow building 'tile' or blocks. The application of these tile to residence construction as well as to other structures is growing; though their total for 1927 shows a drop from the figures of 1926.

The aggregate value of all kinds of brick in 1927 shows a decrease of approximately 7 per cent from that of 1926, to which each of the groups contributed.

Bulletin No. 99, "The Clay Resources and the Ceramic Industry of California," published this year (1928) covers all the brick plants throughout the state, giving a detailed description of each.

The detailed figures of brick and tile production for 1927, by counties, are shown in the following tabulation:

Sand Pit of Ione Fire Brick Co., Amador County. Photo by courtesy of the company.

Brick and Hollow Tile Production of California, by Years.

Record of brick production in the state has been kept since 1893 by this Bureau, the figures for hollow building 'tile' or blocks being also included since 1914. The annual and total figures, for amount and value, are given in the following table:

<i>Year</i>	<i>Brick, M</i>	<i>Hollow building blocks, tons</i>	<i>Value</i>
1893	103,900	-----	\$801,750
1894	81,675	-----	457,125
1895	131,772	-----	672,360
1896	24,000	-----	524,740
1897	97,468	-----	563,240
1898	100,102	-----	571,362
1899	125,950	-----	754,730
1900	137,191	-----	905,210
1901	130,766	-----	860,488
1902	169,851	-----	1,306,215
1903	214,403	-----	1,999,546
1904	281,750	-----	1,994,740
1905	286,618	-----	2,273,786
1906	277,762	-----	2,538,848
1907	362,167	-----	3,438,951

CEMENT

Bibliography: State Mineralogist Reports VIII, IX, XII, XIV, XV, XVII, XVIII, XXI-XXIII, Bulletin 38.

Cement is the most important single structural material in the mineral output of California. During 1927 there was produced a total of 14,661,783 barrels valued at \$26,474,935 f. o. b. plant, being an increase of over half a million barrels in quantity, and in total value although there was a small drop in prices. The 1926 output was 13,797,173 barrels, valued at \$25,269,678, or an average of \$1.84 per barrel. The 1927 average was \$1.80 per barrel.

The 1927 production came from twelve operating plants in ten counties, and employed a total of 3803 men. The three plants in San Bernardino County made a total of 5,557,339 barrels, valued at \$9,823,839, the balance of the state's product coming from a single plant in each of the following counties: Calaveras, Contra Costa, Kern, Merced, Riverside, San Benito, San Mateo, Santa Cruz, and Solano. The new plant of the Yosemite Portland Cement Company at Merced began operations and made commercial shipments in 1927.

There has been an interesting parallelism in the growth of the portland cement and the crushed rock, sand and gravel industries in California. The use of concrete has been a most important development in structural work during the last 20 or 30 years, and has made possible the building of such great monolithic structures as our irrigation and hydroelectric-power dams, as well as highway pavements and skyscraper office buildings.

In 1927 the total production of the United States as given by the U. S. Bureau of Mines, was 171,864,728 barrels of portland cement valued at \$278,854,647, of which approximately 45,000,000 barrels were used in the construction of roads and streets in the United States, from which approximately 6000 miles of concrete rural roads, 3000 miles of streets, and 475 miles of alleys were built.

Cement Production of California, by Years.

'Portland' cement was first commercially produced in California in 1891; though in 1860 and for several years following, a natural hydraulic cement from Benicia was utilized in building operations in San Francisco.

¹"The Benicia Cement Company in 1859-60 was turning out 50 to 100 barrels of cement a day and San Francisco was using about 12,000 barrels a year. The mill price of the product was then \$4 a barrel. By 1865, the San Francisco rate of consumption had increased to 100,000 barrels yearly, brick buildings largely taking the place of frame structures, and the price of cement had fallen to \$2.50 a barrel, about the same as it is today."

The growth of the industry became rapid after 1902; since which time cement has continued to be an important factor in the industrial life of the state. Although the total cement figures, to date, are not of the same magnitude as those for gold and petroleum, it is interesting to note that the value of California's cement yield beginning with 1920 has since annually exceeded the value of her gold output.

Annual production of cement in California has been as follows:

Year	Barrels	Value	Year	Barrels	Value
1891.....	5,000	\$15,000	1911.....	6,371,369	\$9,085,625

CHROMITE

Bibliography: State Mineralogist Reports IV, XII, XIII, XIV, XV, XVII, XVIII, XXI-XXIII. Bulletins 38, 76, 91. Preliminary Report 3. U. S. G. S., Bull. 430. Min. & Sci. Press, Vol. 114, p. 552.

Chromic iron ore, or chromite, to the amount of 225 short tons recalculated to the basis of 45% Cr_2O_3 , valued at \$5,063 f. o. b. shipping point, was sold during the year 1927 in California. This was largely of ore that had been mined during the World War period but not then sold. It is hoped that the development of the steel industry and the resumption of copper smelting on the Pacific Coast may create some demand for California's chromite, but the outlook for the immediate future is not encouraging.

The political and commercial control of chromite now rests largely with England, through the ownership and sales contracts exercised by the Chrome Company (Ltd.), of London. That company controls both the Rhodesian and the New Caledonian output.

Occurrence.

Until 1916, when some shipments were made from Oregon and smaller amounts from Maryland, Wyoming and Washington, practically our only domestic production of chromite for many years came from California. From 1830 to 1870 the deposits in Maryland supplied the world's consumption.

Chromite is widely distributed in California, the principal production, thus far, having come from El Dorado, San Luis Obispo, Del Norte, Shasta, Siskiyou, Placer, Fresno, and Tuolumne counties. In 1918 a total of 29 counties contributed to the state's output. There are two main belts in California yielding this mineral, one along the Coast Ranges from San Luis Obispo County to the Oregon line, including the Klamath Mountains at the north end, and the other in the Sierra Nevada from Tulare County to Plumas County. Chromite occurs as lenses in basic igneous rocks such as peridotite and pyroxenite, and in serpentines which have been derived by alteration of such basic rocks. For the most part, so far as developments have yet shown, the lenses have proved to be small, relatively few of them yielding over 100 tons apiece. A notable exception to this was the deposit on Little Castle Creek, near Dunsmuir, from which upwards of 15,000 tons were shipped before it was exhausted. Deposits worked in Del Norte County during 1918 promise well for a large tonnage. On the whole the orebodies in the northwestern corner of the state appear to average larger in size than the chromite lenses in other parts of California.

Concentration became an accomplished fact in several localities, thus utilizing some of the disseminated and lower-grade orebodies which have been found. In fact, an important part of the 1918-1920 production of California came from that source.

Imports.

Importations of foreign chromite, duty free, mainly from Rhodesia, New Caledonia, and India, totaled 222,360 long tons in 1927, valued at \$1,738,598, compared with 215,464 long tons and \$1,704,947 in 1926.

Uses.

The major consumption of chromite ore is for use as a refractory lining in smelting furnaces for steel and copper. A smaller portion is used in the preparation of ferrochrome for chrome-steel alloys, and of chromium chemicals, the latest development of which is chrome plating as used in the automobile industry, on ships, and in oil refineries to protect metal surfaces from wear and erosion. It is stated that during the last three years, the sales of chromite brick and chromite cement have increased 500%, because of their replacing magnesite which is more expensive.

Total Chromite Production of California.

Production of chromite in California began, apparently, about 1874, principally in San Luis Obispo County. There was considerable activity from 1880 to 1883, inclusive, and a total of 23,238 long tons (or 26,028 short tons), valued at \$329,924 was shipped from that county up to the beginning of 1887. Some ore also was shipped from the Tyson properties in Del Norte County. The tabulation herewith shows the output of chromite in California, annually, including the earliest figures so far as they are available. The figures from 1887 to date are from the records of the State Mining Bureau:

Year	Tons	Value	Year	Tons	Value
1874-1876 (San Luis Obispo County).....	26,028	\$329,924	1908.....	350	\$6,195
1887.....	3,000	40,000	1909.....	436	5,309
1888.....	1,500	20,000	1910.....	749	9,707

GRANITE

Bibliography: State Mineralogist Reports, X, XII-XXI (inc.). Bulletin 38.

The value of the granite output in 1927 was \$1,398,443, an increase over the 1926 figure of \$655,332, but not reaching the record output of \$1,853,859 in 1925. We have included under this heading some rhyolite and tuff utilized for dimension building stone, as we have no other dimension-stone grouping for statistical purposes in this report except marble and sandstone.

So far as possible, granite production has been segregated in the table herewith into the various uses to which the product was put. It

will be noted, however, that a portion of the output has been entered under the heading 'Unclassified.' This is necessary because of the fact that some of the producers have no way of telling to what specific use their stone was put after they had quarried and sold the same in the rough.

Varieties.

For building purposes, the granites found in California, particularly the varieties from Raymond in Madera County, Rocklin in Placer County, and near Porterville in Tulare County, are unexcelled by any similar stone found elsewhere. The quantities available, notably at Raymond and Porterville, are unlimited. Most of California's 'granite,' particularly that found in the Sierra Nevada Mountains, is technically 'granodiorite' (that is, both plagioclase and orthoclase feldspars are present).

Granites of excellent quality for building and ornamental purposes are also quarried in Riverside and San Diego counties. Near Lakeside, San Diego County, there is a fine-grained, 'silver gray' granite of uniform texture and color, especially suited for monumental and ornamental work.

The Fresno County stone is a dark, hornblende diorite, locally called 'black granite,' whose color permits of a fine contrast of polished and unpolished surfaces, making it particularly suitable for monumental and decorative purposes. There is also a similar 'black granite' in Tulare County, near Success.

Granite Production, by Counties, for 1927

County	Building stone		Monumental		Curbing		Unclassified		Total value
	Cubic ft.	Value	Cubic ft.	Value	Linear ft.	Value	Cubic ft.	Value

LIME

Bibliography: Reports XIV, XV, XVII, XVIII. Bulletin 38.

Lime to the amount of 60,498 tons, valued at \$631,497, was produced by nine plants in seven counties during 1927, as compared with 63,568 tons, valued at \$670,837, in 1926. There were two plants each in San Bernardino and Santa Cruz counties, and one each in Inyo, Kern, Plumas, Tulare, and Tuolumne.

So far as we have been able to segregate the data, these figures include mainly only such lime as is used in building operations; though they do include a small proportion of calcined lime employed in agriculture and the chemical industries, the figures for which were not separable. A portion is hydrated lime. Limestone utilized in sugar making, for smelter flux, as a fertilizer, and other special industrial uses, are classified under 'Industrial Materials.' That consumed in cement manufacture is included in the value of cement.

Lime Production of California, by Years.

The following tabulation gives the amounts and value of lime produced in California by years since 1894 when compilation of such records was begun by the State Mining Bureau. The figures for quantity have been recalculated from 'barrels' to 'tons' for the years 1894-1922 (inc.):

Year	Tons	Value	Year	Tons	Value
1894.....	37,350	\$318,700	1912.....	52,212	\$464,440
1895.....	39,776	386,094	1913.....	61,344	528,517

MAGNESITE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVII-XXIII. Bulletins 38, 79, 91. U. S. Geol. Surv. Bulletins 355, 540; Min. Res. 1913, Pt. II, pp. 450-453. Min. & Sci. Press, Vol. 114, p. 237. "Magnesite"—Hearings before the Comm. on Ways and Means, House of Repr., on H. R. 5218, June 16, 17, and July 17, 1919. Eng. Soc. W. Penn., Proc. 1913, Vol. 29, pp. 305-388, 418-444. Eng. & Min. Jour.-Press, Vol. 114, July 29, and Dec. 2, 1922. U. S. Tariff Comm., "Crude and Caustic Calcined Magnesite. A Preliminary Statement of Information," May 19, 1926.

The production of magnesite in California during 1927 amounted to a total of 46,093 tons of crude ore, valued at \$577,887. Only a small part of it was sold 'crude,' however, as it is practically all shipped in the calcined form. The reports at hand show a total of 19,277 tons shipped calcined, including a small tonnage dead-burned for refractory purposes, the balance going to the plastic trade. From 2 to 2½ tons of crude material are mined to make one ton of calcined. The 1927 output is a decrease both in quantity and value from the 1926 figures of 50,915 tons crude valued at \$587,642. The average of the values reported for 1927 is \$12.50 per ton compared with \$11.60 in 1926. There were two operators who produced 1300 tons of crude but who had not shipped any during 1927 though they expect to do so in 1928.

Occurrence.

Magnesite is a natural carbonate of magnesium, and when pure contains 52.4% CO₂ (carbon dioxide), and 47.6% MgO (magnesia). It has a hardness of 3.5 to 4.5, and specific gravity of 3 to 3.12. It is both harder and heavier than calcite (calcium carbonate), and also contains a higher percentage of CO₂ as calcite has but 44%.

Most of the Californian magnesite is comparatively pure, and is ordinarily a beautiful, white, fine-grained rock with a conchoidal fracture resembling a break in porcelain. The Grecian magnesite is largely of this character; but the Austrian varieties usually contain iron, so that they become brown after calcining. The Washington magnesite resem-

bles dolomite and some crystalline limestones in physical appearance. Its color varies through light to dark gray, and pink.

In California the known deposits are mostly in the metamorphic rocks of the Coast Ranges and the Sierra Nevada, being associated with serpentine areas. The notable exceptions are the sedimentary deposits, at Bissell in Kern County and at Afton in San Bernardino County. Several thousand tons have been shipped from the Bissell deposit; and small shipments have been made from the Afton property.

The Washington deposits are associated with extensive strata of dolomite limestone. The magnesite there appears to contain more iron than most of the California mineral, which makes it desirable for the steel operators. However, recent experience has proved that several California localities have sufficient iron in their magnesite to be serviceable in the steel furnaces.

Uses.

The principal uses include: Refractory linings for basic open-hearth steel furnaces, copper reverberatories and converters, bullion and other metallurgical furnaces; in the manufacture of paper from wood pulp; and in structural work, for exterior stucco, for flooring, wainscoting, tiling, sanitary kitchen and hospital finishing, etc. In connection with building work it has proved particularly efficient as a flooring for steel railroad coaches, on account of having greater elasticity and resilience than 'Portland' cement. For refractory purposes the magnesite is 'dead-burned'—*i. e.*, all or practically all of the CO_2 is expelled from it. For cement purposes it is left 'caustic'—*i. e.*, from 2% to 10% of CO_2 is retained. When dry caustic magnesite is mixed with a solution of magnesium chloride (MgCl_2) in proper proportions, a very strong cement is produced, known as oxychloride or Sorel cement. It is applied in a plastic form, which sets in a few hours, as a tough, seamless surface. It has also a very strong bonding power, and will hold firmly to wood, metal, or concrete as a base. It may be finished with a very smooth, even surface, which will take a good wax or oil polish. As ordinarily mixed there is added a certain proportion of wood flour, cork, asbestos, or other filler, thereby adding to the elastic properties of the finished product. Its surface is described as 'warm' and 'quiet' as a result of the elastic and nonconducting character of the composite material. The cement is frequently colored by the addition of some mineral pigment to the materials before mixing as cement.

For refractory purposes the calcined magnesite is largely made up into bricks similar to fire-brick for furnace linings. It is also used unconsolidated, as 'grain' magnesite. For such, an iron content is desirable, as it allows a slight sintering in forming the brick. Dead-burned, pure magnesia can not be sintered except at very high temperatures; and it has little or no plasticity, so that it is hard to handle. Its plasticity is said to be improved by using with it some partly calcined or caustic magnesite. Heavy pressure will bind the material sufficiently to allow it to be sintered.

A coating of crushed magnesite is laid on hearths used for heating steel stock for rolling, to prevent the scale formed from attacking the fire-brick of the hearth.

Before the World War, practically all of the domestic output of caustic magnesite was used in the manufacture of pulp and paper. For this purpose calcined dolomite is now used. The use of dolomite instead of magnesite by paper manufacturers began during the war when the price of magnesite was very high. Dolomite was found to be a good substitute for magnesite in the bisulphite process of paper making and so its use has continued.

Imports.

The Tariff Act of 1922, which became effective September 22d, of that year, placed the following import duties on magnesite: Crude magnesite $\frac{5}{16}\text{¢}$ per lb., caustic-calcined magnesite $\frac{5}{8}\text{¢}$ per lb.; dead-burned and grain magnesite, not suitable for manufacture into oxy-chloride cements, $\frac{23}{40}\text{¢}$ per lb.; magnesite brick, $\frac{3}{4}\text{¢}$ per lb. and 10% ad valorem. The figures of imports for 1927, as published by the U. S. Bureau of Foreign and Domestic Commerce, show a total of 60,224 short tons of calcined ore, valued at \$959,483, as compared with 92,546 tons and \$1,415,509 in 1926.

Total Magnesite Production of California.

The first commercial production of magnesite in California was made in the latter part of 1886 from the Cedar Mountain district,¹ southeast of Livermore, Alameda County. Shipments amounting to 'several tons' or 'several carloads' were sent by rail to New York; but there is apparently no exact record of the amount for that first year. The statistical records of the State Mining Bureau began with the year 1887, and the table herewith shows the figures for amount and value, annually, from that time. Shipments of magnesite from Napa County began in 1891 from the Snowflake Mine; from the Red Mountain deposits in Santa Clara County, in 1899; and from Tulare County in 1900.

Year	Tons	Value	Year	Tons	Value
1887.....	600	\$9,000	1909.....	7,942	\$62,588

MARBLE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVII-XXII (inc.). Bulletin 38. U. S. Bur. of Mines, Bull. 106.

Marble is widely distributed in California, and in a considerable variety of colors and grain. The 1927 figures show a slight decline in both quantity and value from those of 1926, and are combined with onyx and travertine to conceal the output of a single operator.

California has many beautiful and serviceable varieties of marble, suitable for almost any conceivable purpose of construction or decoration. In the decorative class are deposits of onyx marble of beautiful coloring and effects. There is also serpentine marble suitable for electrical switchboard use.

Marble Production of California, by Years.

Data on annual production since 1887, as compiled by the State Mining Bureau, follows. Previous to 1894 no records of amounts were preserved.

Year	Cubic feet	Value	Year	Cubic feet	Value
1887		\$5,000	1909	79,600	\$238,400
1888		5,000	1910	18,960	50,200

^bIncludes onyx.

ONYX and TRAVERTINE

Bibliography: State Mineralogist Reports XII-XV (inc.), XVII, XVIII. Bulletin 38.

Onyx and travertine are known to exist in a number of places in California, but there has been only a small and irregular production since the year 1896. In 1927 there were shipments from Kern, Riverside, San Bernardino, and Solano counties with an increase in both quantity and value, the figures of which are combined with marble. This material is used in terrazzo, auto gear-shift handles, bases for fountain-pen desk sets, and other ornamental purposes.

Onyx Production of California, by Years.

Production by years has been as follows:

Year	Value	Year	Value
1887.....	\$900	1919.....
1888.....	900	1920.....
1889.....	900	1921.....	\$1,294
1890.....	1,500	1922.....	3,320
1891.....	2,400	1923.....	2,510
1892.....	1,800	1924.....

SANDSTONE.

Bibliography: State Mineralogist Reports XII-XV, XVII, XVIII, XXI. Bulletin 38. U. S. Bur. of M., Bull. 124.

An unlimited amount of high-grade sandstone is available in California, but the wide use of concrete in buildings of every character, as well as the popularity of a lighter-colored building stone, has curtailed production in this branch of the mineral industry during recent years almost to the vanishing point. In 1927 a total of 22,900 cu. ft., valued at \$205,400, was quarried in five counties, Monterey, Napa, Santa Barbara, Siskiyou and Sonoma; compared with 34,100 cu. ft. and \$17,500 in 1926. The material reported from Monterey County is in reality an indurated shale of the Monterey series, of a cream color and utilized as a building stone; and that from Sonoma is a stratified, altered andesite having the appearance of sandstone.

A large portion of the sandstone was sold for landscape work and used as stepping stones for walks and for fountains, walls, etc.

Sandstone Production of California, by Years.

Amount and value, so far as contained in the records of this Bureau, are presented herewith, with total value from 1887 to date:

Year	Cubic feet	Value	Year	Cubic feet	Value
1887.....		\$175,000	1909.....	79,240	\$37,032
1888.....		150,000	1910.....	165,971	80,443

SLATE

Bibliography: State Mineralogist Reports XV, XVIII. Bulletin 38. U. S. Geol. Surv., Bull. 586. U. S. Bur. of Mines, Bull. 218.

Slate was first produced in California in 1889. Up to and including 1910 such production was continuous, but since then it has been irregular. Large deposits of excellent quality are known in the state, especially in El Dorado, Calaveras and Mariposa counties, but the demand has been light owing principally to competition of cheaper roofing materials.

'Slate' is a term applied to a fine-grained rock that has a more or less perfect cleavage, permitting it to be readily split into thin, smooth sheets. Varieties differ widely in color and have a considerable range in chemical and mineralogical composition. Excepting certain rare slates of igneous origin (of which the green slate of the Eureka quarry, El Dorado County, California, is an example) formed from volcanic ash or igneous dikes, slates have originated from sedimentary deposits consisting largely of clay. By consolidation, and the pressure of superimposed materials, clays become bedded deposits of shale. By further consolidation under intense pressure and high temperature incident to mountain-building forces, shales are metamorphosed to slates. The principal mineral constituents are mica, quartz, and chlorite, with smaller varying amounts of hematite, rutile, kaolin, graphite, feldspar, tourmaline, calcite, and others.

The color of slate is of economic importance. The common colors are gray, bluish gray, and black, though reds and various shades of green are occasionally found.

The permanency of slate for roofing is well known. It is stated that there are slate roofs in Pennsylvania and Maryland over 100 years old.

¹ "In England and Wales, and in France, many buildings constructed in the 15th and 16th centuries were roofed with slate, and the roofs are still in excellent condition. There is a record of a chapel in Bedford-on-Avon in Wiltshire, England, roofed with slate in the 8th century, and after 1200 years of climatic exposure is moss-covered but in good condition."

Contrary to the general impression, however, the major portion of the slate produced in the United States is used on the inside rather than the outside of buildings. Its interior uses include stationary washtubs, electrical switchboards, and blackboards.

A square of roofing slate is a sufficient number of pieces of any size to cover 100 square feet of roof, with allowance generally for a three-inch lap. The sizes of the pieces of slate making up a square range from 7 x 9 inches to 16 x 24 inches, and the number of pieces in a square ranges from 85 to 686. The Ferry Building, San Francisco, is roofed with Eureka slate from El Dorado County.

In California there were shipments in 1927 amounting to 2686 tons valued at \$17,960 from El Dorado, Mariposa and Tuolumne counties. This was an increase over the 1926 output valued at \$7,371. Most of this slate was crushed and used for roofing granules.

¹ Bowles, O., *Slate as a Permanent Roofing Material*: U. S. Bur. of M., Reports of Investigations, Serial No. 2267, July, 1921, p. 4.

Total Production of Slate in California.

A complete record of amount and value of slate produced in California follows:

Year	Squares	Value	Year	Squares	Value
1889.....	4,500	\$18,089	1906.....	10,000	\$100,000

MISCELLANEOUS STONE

Bibliography: State Mineralogist Reports XII-XXIII (inc.). Bulletin 38; also annual statistical bulletins from 1915 to date.

'Miscellaneous stone' is the name used throughout this report as the title for that branch of the mineral industry covering crushed rock of all kinds, paving blocks, sand and gravel, and pebbles for grinding mills. The foregoing are very closely related from the standpoint of the producer; therefore it has been found to be most satisfactory to group these items as has been done in recent reports of this Bureau. So far as it has been possible to do so, crushed rock production has been subdivided into the various uses to which the product was put. It will be noted, however, a very large percentage of the output has been tabulated under the heading 'Unclassified.' This is necessary because of the fact that many of the producers have no way of telling to what specific use their rock was put (or at least the proportions to each use) after they have quarried and sold the same to distributors and contractors.

In addition to amounts produced by commercial firms, both corporations and individuals, there is hardly a county in the state but uses more or less gravel and broken rock on its roads. Of much of this, particularly in the country districts, there is no definite record kept.

For the year 1927 the production of crushed rock registered a gain both in tonnage and value over the preceding year. Sand and gravel tonnage remained practically the same, although there was a drop in their value. This resulted in a total value of \$18,911,194, being a decrease from \$19,859,873 in 1926.

As for some years past, Los Angeles County led all others by a wide margin with an output valued at \$6,292,078 (compared with \$7,472,884 in 1926); followed by Alameda, second, with \$1,538,017; River-

side, third, with \$1,244,043; Fresno, fourth, with \$1,118,761; San Diego, fifth, with \$889,642; Contra Costa, sixth, with \$816,140; Sacramento, seventh, with \$754,206; Humboldt, eighth, with \$554,963; followed in turn by Santa Clara, Ventura, Marin, San Benito, Orange, San Bernardino, Stanislaus, Monterey.

Paving Blocks.

The paving block industry has decreased materially of recent years, practically to the vanishing point, because of the increased construction of smoother pavements demanded by motor vehicle traffic. The blocks made in Solano County were of basalt; those from Sonoma are of basalt, andesite, and some trachyte, while those from Madera, Placer, Riverside, San Bernardino, and San Diego are of granite.

The amount and value of paving block production, annually, since 1887 has been as follows:

Year	Amount M	Value	Year	Amount M	Value
1887	*10,000	\$350,000	1909	4,503	\$199,803
1888	10,500	367,500	1910	4,434	198,916
1889	7,303	297,236	1911	4,141	210,819
1890	7,000	245,000	1912	11,018	578,355
1891	5,000	150,000	1913	6,364	363,505
1892	*3,000	96,000	1914	6,053	270,598
1893	2,770	96,950	1915	3,285	171,092
1894	2,517	66,981	1916	1,322	54,362
1895	2,332	73,338	1917	938	38,567
1896	4,161	77,584	1918	372	17,000
1897	1,711	35,235	1919	27	1,350
1898	1,144	21,725	1920	63	3,155
1899	305	7,861	1921	4	280

*Figures for 1887-1892 (inc.) are for Sonoma County only, as none are available for other counties during that period though Solano County quarries were then also quite active.

Grinding Mill Pebbles.

Production of pebbles for tube and grinding mills began commercially in California in 1915. Owing to the decreased imports and higher prices of Belgium and other European flint pebbles, due to the war, there was a serious inquiry for domestic sources of supply. In 1916 and 1917 shipments totaled in excess of 20,000 tons per year; but they have since dropped to an insignificant figure. San Diego County has been the principal contributor, with some also from Fresno and Sacramento. Shipments have been made to metallurgical plants in California, Nevada, Montana and Utah.

Imports in 1927 amounted to 13,563 long tons, valued at \$93,658 compared with 13,474 long tons and \$120,078 in 1926.

California output for 1927 was 288 tons, valued at \$1,800, an increase from the 1926 figures.

The amount and value of grinding mill pebbles, annually, follows:

Year	Tons	Value
1915	340	\$2,810
1916	20,232	107,567
1917	21,450	90,538
1918	8,628	61,268
1919	2,607	19,272
1920	2,104	17,988
1921	247	1,418
1922	1,571	7,628
1923	2,650	14,936
1924	434	2,969
1925	215	1,385
1926	102	612
1927	288	1,800
Totals	60,868	\$260,191

Sand and Gravel.

A considerable part of the gravel excavated is passed through grading and washing plants, and the material over 2 inches in size is crushed. Much of it is utilized in concrete mixtures. Most of the gravel used for road surfacing and repairs as well as that for railroad ballast is creek-run or pit-run material which is spread upon the roads without undergoing any grading or washing.

The distribution of the 1927 output of sand and gravel, by counties, is given in the following table:

County	Tons	Value
Alameda	^a 1,696,707	\$1,306,182
Butte	46,590	39,292
Contra Costa	^a 138,883	78,703

* Combined to conceal output of a single operator in each.

a Includes red roofing granules.

b Includes roofing granules.

c Includes green granules for roofing and terrazzo.

d Includes greenstone roofing granules.

e Includes ornamental pebbles.

f Includes gannister.

g Includes smelter slag.

Included in the above is a total of 46,930 tons of molding sand, valued at \$128,752 f. o. b. pit from two operators each in Riverside and San Diego counties, and one each in Alameda, Contra Costa, Sacramento, San Francisco, San Luis Obispo and Ventura. This item is each year assuming a more important position in the commercial mineral list of California. The 1926 figures totaled 46,601 tons and \$105,336.

Crushed Rock.

To list the kinds and varieties of rock utilized commercially under this heading would be to run almost the entire gamut of the classification scale. Much depends on the kind available in a given district. Those which give the most satisfactory service are the basalts and other hard, dense, igneous rocks which break with sharp, clean edges. In many localities, river-wash boulders form an important source of such material. In such cases, combined crushing and washing plants obtain varying amounts of sand and gravel along with the crushed sizes. In Sacramento and Butte counties the tailings piles from the gold dredgers are the basis of like operations.

The values given are based on the selling prices, f. o. b. cars, barges, or trucks, at the quarry.

Miscellaneous Stone Production of California, by Years.

The amount and value, annually, of crushed rock (including macadam, ballast, rubble, riprap, and that for concrete), and sand and gravel, since 1893, follow:

Crushed Rock, Sand and Gravel, by Years

Year	Tons	Value	Year	Tons	Value
1893.....	371,100	\$456,075	1912.....	8,044,937	\$4,532,598

1909.....	5,531,561	2,708,326			
1910.....	5,827,828	2,777,690			
1911.....	6,487,223	3,610,357	Totals.....	241,005,902	\$173,364,566

A comparison of the above table of annual production of these materials with the similar table for cement (see *ante*), reveals the fact that the important growth of the crushed rock and gravel business has been coincident with the rapid development of the cement industry from the year 1902.

CHAPTER FIVE

INDUSTRIAL MATERIALS

Bibliography: State Mineralogist Reports XII-XXIII (inc.). Bulletin 38. Min. & Sci. Press, Vol. 114, March 10, 1917. Spurr and Wormser, "Marketing of Metals and Minerals." "Non-Metallic Minerals," by R. B. Ladoo. See also under each substance.

The following mineral substances have been arbitrarily arranged under the general heading of 'Industrial Materials,' as distinguished from those which have a clearly defined classification, such as metals, salines, structural materials, etc.

These materials, many of which are mineral earths, are, with four or five exceptions, as yet produced on a comparatively small scale. The possibilities of development along several of these lines are large, and with increasing transportation and other facilities, together with steadily growing demands, the future for this branch of the mineral industry in California is promising. There is scarcely a county in the state but might contribute to the output.

Up to within the last few years, at least, production has been in the majority of instances dependent upon more or less of a strictly local market, and the annual tables show the results of such a condition, not only in the widely-varying amounts of a certain material produced from year to year, but in widely-varying prices of the same material.

The more important of these minerals thus far exploited, so far as shown by value of the output, are limestone, mineral water, pyrites, pottery clays, diatomaceous earth, gypsum, talc, dolomite, fuller's earth.

This group as a whole showed an increase in the total value to \$5,258,068 in 1927 from \$4,675,924 for 1926.

The following table gives the comparative figures for the amounts and value of industrial minerals produced in California during the years 1926 and 1927:

Substance	1926		1927		Increase+ Decrease— Value
	Amount	Value	Amount	Value	
Barytes.....	4,978 tons	\$38,165	17,993 tons	\$90,617	\$52,452+
Clay (pottery).....	797,461 tons	806,509	867,419 tons	872,661	66,152+
Dolomite.....	68,640 tons	119,313	45,976 tons	79,422	39,891—
Feldspar.....	7,300 tons	56,400	10,932 tons	86,101	29,701+
Fuller's earth.....	23,552 tons	250,192	13,018 tons	154,764	95,428—
Gems.....		9,049		7,035	2,014—

ASBESTOS

Bibliography: State Mineralogist Reports XII-XIX (inc.), XXII. Bulletins 38, 91. Canadian Dept. of M., Mines Branch Bulletin 69. Min. & Sci. Press, April 10, 1920, pp. 531-533. Eng. & Min. Jour.-Press, Vol. 113, pp. 617-625, 670-677. Asbestology, Vol. 5, No. 7, July, 1927.

In 1927 there was a small tonnage of crude asbestos ore and fibre produced in California, but as there was only a single operator, the figures are concealed under the 'Unapportioned' item.

The future of asbestos mining in California is dependent largely upon the development of uses in quantity for the short-fibre mill grades, and for the amphibole variety. There are apparently large resources of such material that can be made available. Some spinning-grade fibre has also been found in this state, notably in Nevada, Calaveras, and Monterey counties, but the commercial yield to date has been small. There are extensive serpentine areas in the Coast Ranges, in the Klamath Mountains, and in several sections of the Sierra Nevada which are within the range of possible asbestos producers, as chrysotile is a fibrous form of serpentine. These localities all yielded chromite in greater or less amounts during the World War period.

Three-quarters of the world's supply of asbestos was for many years produced by Canada.

At present, Rhodesia furnishes 60 per cent of the long fibre, though Canada in addition to its long fibre still accounts for practically the entire output of lower grades.

Asbestos Production of California, by Years.

Total amount and value of asbestos production in California since 1887, as given in the records of this Bureau, are as follows:

Year	Tons	Value	Year	Tons	Value
1887.....	30	\$1,800	1909.....	65	\$6,500
1888.....	30	1,800	1910.....	200	20,000

BARYTES

Bibliography: State Mineralogist Reports XII, XIV, XV, XVII, XXI. Bulletin 38. Eng. & Min. Jour.-Press, Vol. 114, p. 109, July 15, 1922; Vol. 115, pp. 319-324, Feb. 17, 1923.

Commercial shipments of crude barytes in California in 1927

amounted to a total of 17,993 tons, valued at \$90,617 f.o.b. rail-shipping point, being a marked increase in both quantity and value over the 1926 figures of 4978 tons and \$38,165. The 1927 yield came from properties in Mariposa, Nevada and Orange counties. The barytes from Mariposa and Nevada counties was consumed principally in the manufacture of lithopone. That from Orange County was a furnace sinter, being a barytes gangue in a quicksilver ore, and was sold for use in oil-well drilling mud.

More than half of the total tonnage of barytes utilized in the United States is taken in the manufacture of lithopone, which is a chemically-prepared white pigment containing approximately 70% barium sulphate and 30% zinc sulphide. This is one of the principal constituents of 'flat' wall paints. Other important uses for barytes, after washing and grinding, are as an inert pigment and filler in paint, paper, linoleums, oilcloth and rubber manufacture, and in the preparation of a number of chemicals including barium binocide, carbonate, chloride, nitrate, and the sulphate precipitated, or 'blanc fixe.'

Present quotations for barytes vary from \$7 to \$9 per ton, crude, f.o.b. rail-shipping point, depending on quality. Most baryte has to be washed and acid treated to remove iron stains or other impurities before being suitable for paint use.

Known occurrences of this mineral in California are located in Inyo, Los Angeles, Mariposa, Monterey, Nevada, San Bernardino, Shasta and Santa Barbara counties. The deposit at El Portal, in Mariposa County, has given the largest commercial production to date, in part witherite (barium carbonate, BaCO_3). Witherite has also been found in Shasta County, but no shipments have yet been made from the deposit.

Total Barytes Production of California.

The first recorded production of barytes in California, according to the statistical reports of the State Mining Bureau, was in 1910. The annual figures are as follows:

Year	Tons	Value	Year	Tons	Value
1910.....	860	\$5,640	1920.....	3,029	\$20,795

CLAY (Pottery)

Bibliography: State Mineralogist Reports I, IV, IX, XII-XV, XVIII-XXIII (inc.). Bulletins 38, 99. Preliminary Report No. 7. U. S. Bureau of Standards, Tech. Paper No. 262.

At one time or another in the history of the state, pottery clay has been mined in thirty-three of its counties. Of these, 21 contributed in 1926. In this report, 'pottery clay' refers to all clays used in the manufacture of red and brown earthenware, china and sanitary ware, flower pots, floor, faience and ornamental tiling, architectural terra cotta, sewer pipe, drain and roof tile, etc., and the figures for amount

Airplane view Gladding McBean & Co. plant at Lincoln, Placer Co. Photo by courtesy of the company.

and value are relative to the crude material at the pit, without reference to whether the clay was sold in the crude form or was immediately used in the manufacture of any of the above finished products by the producer. It does not include clay used in making brick and hollow building blocks.

There are many other important uses for clays besides pottery manufacture. Among these may be enumerated paper, cotton goods, and chemicals. Being neutral, clay does not have an injurious effect upon other constituents used in the manufacture of such articles. In paper making, clay is used as a filler in news and similar grades, and as a coater or glazer in the more highly-finished art papers. A large part

Sewer-pipe press, Los Nietos plant of Pacific Clay Products Co., Los Angeles County. Photo by courtesy of the company.

of the china clay used in the United States is imported from England. Clays of the montmorillonite and halloysite group ('rock soap') are being utilized successfully in the manufacture of soaps.

During 1927 a total of 63 producers in 21 counties reported an output of 867,419 short tons of pottery clay, having a total value of \$872,661, f. o. b. rail-shipping point, for the crude material, as compared with the 1926 production of 801,461 tons worth \$806,509.

Because of the fact that a given product often requires a mixture of several different clays, and that these are not all found in the same pit, it is necessary for most clay-working plants to buy some part of their raw materials from other localities. For these reasons, in compiling the clay industry figures, much care is required to avoid duplica-

tions. So far as we have been able to segregate the figures, from the data sent in by the operatives, we have credited the clay output to the counties from which the raw material originated; and have deducted tonnages used in brick manufacture, as bricks are classified separately, herein.

A tabulation of the direct returns from the producers, by counties, for the year 1927 is shown herewith:

Pottery Clay in 1927

County	Tons	Value	Used in the manufacture of
Alameda.....	6,593	\$20,516	Architectural terra cotta, chimney, drain and sewer pipe, faience floor and roofing tile.
Amador.....	118,636	165,210	Architectural terra cotta, fire clay products and refractories, chimney and sewer pipe, drain, floor and roofing tile, and various.
Contra Costa.....	7,550	7,125	Conduit, red earthenware, drain, faience, floor and roofing tile.
Los Angeles.....	^a 147,621	206,175	Architectural terra cotta, conduit, red earthenware, refractories, drain, faience, floor and roofing tile, chimney and sewer pipe, art pottery and oil well mudding.
Monterey.....	1,100	550	Floor and roofing tile.
Orange.....	14,637	49,354	Stoneware, refractories, drain, floor and roofing tile, and various.
Placer.....	61,388	106,710	Architectural terra cotta, drain, chimney and sewer pipe, roofing and floor tile, sanitary and red earthenware, refractories, and various.
Riverside.....	118,514	198,330	Conduit, sewer pipe, red earthenware, refractories, floor and roofing tile, and various.
San Diego.....	^c 16,190	31,765	Sewer pipe, faience, floor and roofing tile, and various.
Santa Clara.....	4,373	4,261	Sewer pipe, art pottery, drain, faience, floor and roofing tile, and various.
Ventura.....	^a 354,418	63,120	Faience, floor and roofing tile, and oil well mudding.
Butte, Calaveras, Humboldt, Kern ^a , Merced, Mono, Sacra- mento, San Bernardino, San Luis Obispo and Stanislaus ^a	16,399	19,545	Architectural terra cotta, chimney, drain, floor and roofing tile, and flue lining, loam, sewer pipe, and oil well mudding.
Totals.....	867,419	\$872,661	

^a Combined to conceal output of a single operator in each.

^b Includes clay and shale for oil well mudding.

^c Includes silt.

^d Includes "Cornwall stone."

Pottery Clay Products.

The values of the various pottery clay products made in California during 1927 totaled \$14,739,689, compared with \$14,625,203 in 1926, their distribution being shown in the following tabulation:

Product	Number of producers	Tons	Value
Architectural terra cotta, chimney pipe and flue lining.....	10	28,517	\$2,439,371
Drain pipe.....	12	6,987	128,258
Roofing tile.....	25	75,014	1,865,970
Sewer pipe.....	8	104,833	2,934,304
Chinaware, semi-vitreous tableware.....	3	-----	528,750
Sanitary ware.....	6	-----	1,903,743
Red earthenware.....	6	-----	181,631
Stoneware and chemical stoneware.....	6	-----	443,053
Floor, faience, mantel, glazed, and hand-made tile.....	30	-----	3,038,501
Miscellaneous art pottery, art tile, bath tile, decorative stands and tile, conduit pipe, electrical porcelain, segment blocks, garden furniture and pottery, glass-tank blocks, radiator and stove backs, ground clay, fireclay and cement, grog, and various.....	27	-----	1,276,108
Total value.....			\$14,739,689

Important increases were shown in flat tile (floor, faience, mantel, etc.), sewer pipe, sanitary ware, and the miscellaneous group, with decreases by architectural terra cotta, chimney pipe and roofing.

Pottery Clay Production of California, by Years.

Amount and value of crude pottery clay output in California since 1887 are given in the following table:

Year	Tons	Value	Year	Tons	Value
1887.....	75,000	\$37,500	1908.....	208,042	\$325,147
1888.....	75,000	37,500	1909.....	299,424	465,647

			Totals.....	7,578,203	\$9,315,304

DIATOMACEOUS EARTH

Bibliography: State Mineralogist Reports II, XII-XV (inc), XVII-XXII (inc.). Bulletins 38, 67, 91. Am. Inst. Min. Eng., Bull. 104, August, 1915, pp. 1539-1550. U. S. Bur. of Mines, Rep. of Investigations: Serial No. 2431, Jan., 1923. Eng. & Min. Jour.-Press, Vol. 115, pp. 1152-1154, June 30, 1923.

Infusorial and diatomaceous earths—sometimes called tripolite—are very light and extremely porous, chalk-like materials composed of pure silica (chalk, being calcareous) which have been laid down under water and consist of the remains of microscopical infusoria and diatoms. The former are animal remains, and the latter are from plants. The principal commercial use of diatomaceous earth (also called 'diatomite') is as an absorbent. It is also employed in the manufacture of scouring soap and polishing powders; for filtration purposes; in making some classes of refractory brick; and as an insulating medium both in heating and refrigeration. It is a first-class nonconductor of heat, where high temperatures are employed, such as around steel and gas plants and power houses. In such cases, it is built in as an insulating layer in furnace walls. In Germany, under the name 'kieselguhr,' it was used as an absorbent for nitroglycerine in the early manufacture of dynamite.

As a nonconductor of heat it has been used alone or with other materials as a covering for boilers, steam pipes and safes, and in fireproof cement. It is used largely by paint manufacturers as a wood filler. Boiled with shellac it is made into records for talking machines. It has been used for absorbing liquid manures so that they could be utilized as fertilizers, and as a source of silica in making water-glass as well as in the manufacture of cement, tile glazing, artificial stone, ultramarine and other pigments of aniline and alizarine colors, paper filling, sealing wax, fireworks, hard-rubber objects, matches, and paper maché, and

for solidifying bromine. For making insulating brick the material is sawed into blocks, and for all other purposes it is ground and screened.

The most important deposits in California thus far known are located in Monterey, Orange, San Luis Obispo, and Santa Barbara counties. The Santa Barbara material is diatomaceous and is of a superior quality, particularly for filtration uses which bring the higher prices. Infusorial or diatomaceous earths are also found in Fresno, Kern, Los Angeles, Plumas, San Benito, San Bernardino, San Joaquin, Shasta, Sonoma, and Tehama counties.

As almost 90% of the output in California is from a single operator, we have concealed the exact figures under the 'Unapportioned' item in the state and county totals. There were six operators in 1927 in Los Angeles, Monterey, Santa Barbara and Shasta counties, the shipments showing a decrease in tonnage and value compared with 1926.

The material shipped was utilized for insulation, filtration, paint pigment, cement admixture, and for clarification of gasoline and kerosene.

Total Production of Diatomaceous Earth in California.

The first recorded production of these materials in California occurred in 1889; total amount and value of output, to date, are as follows:

Year	Tons	Value	Year	Tons	Value
1889.....	39	\$1,335	1910.....	1,843	\$17,617
1890.....			1911.....	2,194	19,670

DOLOMITE

Bibliography: Reports XV, XVII-XXII (inc.). Bulletins 67, 91.

The production of dolomite for the year 1927 totaled 45,976 tons valued at \$79,422, being decreases in both quantity and value from the 1926 figures of 68,640 tons and \$119,313. The 1927 output came from a single quarry each in Inyo and Monterey counties. The material shipped was utilized for steel furnace flux and refractories, and for manufacture of CO₂. Some previously has been used for burned dolomitic lime, for stucco dash-coat, and terrazzo.

Dolomite Production of California, by Years.

Previous to the 1915 statistical report of the State Mining Bureau, dolomite was included under limestone, as the two minerals are closely related chemically; but since dolomite, as such, has been found to have certain distinctive applications, we here give it a separate classification.

Amount and value of the output of dolomite, annually, have been as follows:

Year	Tons	Value
1915.....	4,192	\$14,504
1916.....	13,313	46,566
1917.....	27,911	66,416
1918.....	24,560	79,441
1919.....	24,502	67,953
1920.....	42,388	132,791
1921.....	31,195	99,155
1922.....	52,409	114,911
1923.....	69,519	142,615
1924.....	28,843	71,271
1925.....	42,852	104,900
1926.....	68,610	119,313
1927.....	45,976	79,442
Totals.....	476,300	\$1,139,278

FELDSPAR

Bibliography: State Mineralogist Reports XV, XVII, XVIII, XXI. Bulletins 67, 91. U. S. Bureau of Mines, Bulletin 92. Eng. & Min. Jour.-Press, Vol. 115, pp. 535-538, Mar. 24, 1923.

Feldspar was produced by four operators in three counties (Kern, Riverside and San Diego) during 1927, to the amount of 10,932 tons, valued at \$86,101, being a slight increase both in quantity and value over the 1926 figures, which were 7300 tons and \$56,400.

The requirements of the pottery trade demand that in general the percentage of free silica associated with the feldspar be less than 20%, and in some cases the potters specify less than 5%. An important factor, also, is the iron-bearing minerals frequently present in pegmatites and granites, such as biotite (black mica), garnet, hornblende, and black tourmaline. Feldspar for pottery uses should be practically free of these. The white, potash-mica, muscovite, is not particularly objectionable except that, being in thin, flexible plates, it does not readily grind to a fineness required for the feldspar.

Present quotations are from \$5 to \$9 per ton, crude, according to quality.

The most important developments quantitatively in the feldspar resources of California have thus far taken place in San Diego and Riverside counties, where large deposits of massive, high-grade spar are being opened up. These deposits are unusually free from black mica and other deleterious iron-bearing minerals objectionable in pottery work. The important producing districts are near Lakeside and Campo, in San Diego County, and near Lakeview, Murrietta, and Elsinore, in Riverside County. Other deposits which give promise are

reported from Inyo, Kern and San Bernardino counties. No recent shipments have been reported from Monterey and Tulare counties, formerly important sources.

Total Feldspar Production of California.

Total amount and value of feldspar production in California since the inception of the industry are given in the following table, by years:

Year	Tons	Value	Year	Tons	Value
1910.....	760	\$5,720	1920.....	4,518	26,189
1911.....	740	4,560	1921.....	4,349	28,343
1912.....	1,382	6,180	1922.....	4,587	37,109
1913.....	2,129	7,850	1923.....	11,100	81,800
1914.....	3,530	16,565	1924.....	9,055	68,112
1915.....	1,800	9,000	1925.....	8,165	59,615
1916.....	2,630	14,350	1926.....	7,300	56,400
1917.....	11,792	46,411	1927.....	10,932	86,101
1918.....	4,132	22,061	Totals.....	91,173	\$589,326
1919.....	1,272	12,965			

FLUORSPAR

Bibliography: State Mineralogist Reports XVII, XVIII. Bulletins 67, 91. Eng. & Min. Jour.-Press, Vol. 117, pp. 489-492, Mar. 22, 1924.

Fluorspar, or calcium fluoride, CaF_2 , is one of the most important non-metallic minerals from an industrial standpoint. About 80% of the commercial mineral is prepared in the 'gravel' form and utilized as a flux in the manufacture of steel, for which use no substitute has yet been found. In the United States, under normal business conditions, the consumption for that purpose is 125,000 to 150,000 tons annually. Fluorspar is also used in aluminum smelting, and in the manufacturing of enameled ware, glazed tile and brick, opalescent glass and certain chemicals, particularly hydrofluoric acid and its derivatives. The mineral is marketed in three forms: lump, gravel, and ground.

According to the U. S. Bureau of Foreign and Domestic Commerce, imports of fluorspar into the United States in 1926 amounted to 67,563 long tons, valued at \$747,237, and came principally from England, with smaller amounts from British South Africa, Italy, China and Netherlands. Domestic shipments of fluorspar, according to the U. S. Bureau of Mines, totaled 128,657 short tons, valued at \$2,341,277.

In California deposits have been reported in Los Angeles, Mono, Riverside and San Bernardino counties, but no commercial production has resulted except in 1917-1918, when a total of 79 tons valued at \$991 was shipped from Riverside County.

The Tariff Act of 1922 places a duty of \$5.60 per ton on foreign importations of fluorspar.

Present quotations (Engineering and Mining Journal, New York) are f.o.b. Middle Western Mines, per net ton: Gravel, not less than 85% CaF_2 and not over 5% SiO_2 , \$17; foundry lump, \$18.

FULLER'S EARTH

Bibliography: State Mineralogist Reports XIV, XVII, XVIII, XXI. Bulletins 38, 91. U. S. Bureau of Mines, Bulletin 71. Eng. & Min. Jour.-Press, Vol. 121, pp. 837-842, May 22, 1926.

Fuller's earth includes many kinds of unctuous clays. It is usually soft, friable, earthy, nonplastic, white and gray to dark green in color, and some varieties disintegrate in water. In California, fuller's earth has been used in clarifying both refined mineral and vegetable oils, and for special chemical purposes; although its original use was in fulling wool, as the name indicates. Production has come mainly from Calaveras and Solano counties, with other deposits noted also in Riverside, Fresno, Inyo and Kern counties.

Clays of the montmorillonite and hallosite group ('rock soap') are being utilized by some of the oil refineries in lieu of true fuller's earth in the refining of petroleum products.

The production of 13,018 tons valued at \$154,764 here credited to 1927 as 'fuller's earth' is in reality colloidal clay of the montmorillonite class (sold under such local names as 'bentonite,' 'otaylite,' 'shoshonite,' derived from the locality where found). Because of its being utilized for clarifying, filtering, and cleanser purposes, most of it in petroleum refining, we have placed it, for the purpose of the State Division of Mines and Mining statistical reports, under the fuller's earth heading.

After all, the practical test of a fuller's earth is not so much chemical, as a physical one; that is, its physical capacity to absorb basic colors and to remove these colors from solution in animal, vegetable, or mineral oils, also from water.

The 1927 output above noted is a decrease in both amount and value from the 23,552 tons and \$250,192 in 1926, and came from five properties, in Inyo, Kern, San Bernardino, and San Diego counties.

Fuller's Earth Production of California, by Years.

Fuller's earth was first produced commercially in this state in 1899, and the total amount and value of the output since that time are as follows:

Year	Tons	Value	Year	Tons	Value
1899.....	620	\$12,400	1915.....	692	\$4,002
1900.....	500	3,750	1916.....	110	550
1901.....	1,000	19,500	1917.....	220	2,180
1902.....	987	19,246	1918.....	37	333
1903.....	250	4,750	1919.....	385	3,810
1904.....	500	9,500	1920.....	600	6,000
1905.....	1,344	38,000	1921.....	1,185	8,295
1906.....	440	10,500	1922.....	6,606	48,756
1907.....	100	1,000	1923.....	3,650	55,125
1908.....	50	1,000	1924.....	5,290	67,295
1909.....	459	7,385	1925.....	5,280	91,842
1910.....	340	3,820	1926.....	23 552	250,192
1911.....	466	5,294	1927.....	13,018	154,764
1912.....	876	6,500			
1913.....	460	3,700			
1914.....	760	5,928	Totals.....	69,777	\$845,417

NOTE.—Above production since 1921 has been montmorillonite (hydrous aluminum silicate) a colloidal clay, sometimes called 'rock soap' and 'bentonite,' and in part locally called 'shoshonite' from its being found near Shoshone in Inyo County; and in part 'otaylite' from Otay, San Diego County.

GEMS

Bibliography: State Mineralogist Reports II, XIV, XV, XVII, XVIII, XX, XXI. Bulletins 37, 67, 91. U. S. G. S., 'Mineral Resources of the U. S.'; Bull. 603, p. 208. Bull. Dept. Geol. Univ. of Cal., Vol. 5, pp. 149-153, 331-380. Am. Jour. Sci., Vol. 31, p. 31.

The production of gem materials in California has been somewhat irregular and uncertain since 1911. The compilation of complete statistics is difficult owing to the widely scattered places at which stones are gathered and marketed for the most part in a small way. The material reported in 1927 totaled \$7,035 in value, compared with \$9,049 in 1926, the decrease being due mainly to San Diego County.

The following table shows the distribution of rough, uncut gem and jeweler's materials during 1927:

County	Value	Kind
Butte -----	\$275	Jade (Californite), diamonds.
San Diego -----	3,500	Tourmaline, kunzite, golden and pink beryl, topaz, quartz crystals, spessartite and pyrope garnets, and indicolite.
Calaveras -----	* 3,260	{ Quartz crystals. Quartz crystals. Agate and topaz.
El Dorado -----		
San Bernardino -----		
Total value -----	\$7,035	

* Combined to conceal output of a single operator in each.

Varieties of California's Gem Stones.

Diamonds have been found in a number of localities in California; but in every case, they have been obtained in stream gravels while working them for gold. The principal districts have been: Volcano in Amador County; Placerville, Smith's Flat and others in El Dorado County; French Corral, Nevada County; Cherokee Flat, Morris Ravine, and Yankee Hill, Butte County; Gopher Hill and upper Spanish Creek, Plumas County. The most productive district of recent years has been Cherokee in Butte County.

California *tourmalines* are decidedly distinctive in coloring and 'fire' as compared to foreign stones of this classification. The colors range from deep ruby to pink, and various shades of green, also blue.

One of our California gem stones, *benitoite*, has not been found elsewhere; and in but a single locality here: The Dallas Mine in San Benito County.

Kunzite, a gem variety of spodumene, was first found in the Pala district in San Diego County. It has thus far been found in only one locality (Madagascar) outside of California. It is of a lilac color, and is described in detail in Bulletin 37 of the State Mining Bureau.

Beryls of excellent fire and delicate colors are also obtained in the Pala district, of which the *aquamarine* (blue) and *morganite* (pink) varieties deserve special mention. Morganite, like kunzite, has thus far been found elsewhere only in Madagascar.

Californite, or 'California jade,' is a gem variety of *vesuvianite*, and is green or white in color. It is found in Butte, Fresno, and Siskiyou counties.

Stones of precious blue *topaz* of fine quality are being cut from crystals mined in northern San Diego County. They are associated with beryl and blue tourmaline.

Some *rhodonite* has been mined in Siskiyou County, and used for decorative purposes, its value being included in the marble figures.

Garnets are found in a number of localities in California; the important yield of gems being *hyacinth* and *spessartite* varieties from San Diego County.

Chrysoprase has been produced in Tulare County.

Turquoise has been found in the desert section of San Bernardino County, but none produced commercially in recent years.

Sapphires have been reported found in San Bernardino and Riverside counties, but not as yet confirmed. A few have been found in stream gravels with diamonds in Butte County.

Rubies have been identified by the laboratory of the State Mining Bureau, occurring in limestone from the Baldy Mountains, San Bernardino County. Thus far no stones of commercial size have been taken out.

Total Production of Gem Materials in California.

The value of the gem output in California annually since the beginning of commercial production is as follows:

Year	Value	Year	Value
1900.....	\$20,500	1915.....	\$3,565
1901.....	40,000	1916.....	4,752
1902.....	162,100	1917.....	3,049
1903.....	110,500	1918.....	650
1904.....	136,000	1919.....	5,425
1905.....	148,500	1920.....	36,056
1906.....	497,090	1921.....	10,954

GRAPHITE

Bibliography: State Mineralogist Reports XIII, XIV, XV, XVII. Bulletins 67, 91. U. S. G. S., Min. Res., 1914, Pt. II.

Graphite (also called plumbago) has been produced from time to time in the state, coming principally from Sonoma and Los Angeles counties. It is difficult for these deposits, which must be concentrated, to compete with foreign supplies, which go on the market almost directly as they come from the deposit. Graphite ores are concentrated with considerable difficulty, and the electric process of manufacturing artificial graphite from coal has been perfected to such a degree that only deposits of natural graphite of a superior quality can be exploited with any certainty of success.

According to the U. S. Geological Survey, operators in this country who are working disseminated flake deposits must depend on their No. 1 and No. 2 flake for their profit. Graphite dust is merely a by-product and is salable only at a low price.

The principal value of graphite is on account of its infusibility and resistance to the action of molten metals. It is also largely used in the manufacture of electrical appliances, of 'lead' pencils, as a lubricant, as stove polish, paints, and in many other ways. Amorphous graphite, commonly carrying many impurities, brings a much lower price. For some purposes, such as foundry facings, etc., the low-grade material is satisfactory. Among the interesting uses for graphite is the prevention of formation of scale in boilers. The action is a mechanical one. Being soft and slippery, the graphite prevents the particles of scale from adhering to one another or to the boiler and they are thus easily removed.

The price increases with the grade of material, the best quality crystalline variety being quoted at present (f.o.b. New York) at 7½¢-8¢ per pound (Ceylon lumps).

The coarser flakes are necessary for crucibles, as they help to bind the clay together in addition to their refractory service. Imports in 1927 from Ceylon, Canada, Madagascar, Mexico and Korea, totaled 17,429 short tons valued at \$722,004 compared with 16,194 tons valued at \$923,513 in 1926.

Occurrence of graphite has been reported at various times from Calaveras, Fresno, Imperial, Inyo, Los Angeles, Mendocino, San Bernardino, San Diego, Siskiyou, Sonoma and Tuolumne counties.

During 1927 there was a small commercial output of graphite from Los Angeles County. For several years a single plant in Los Angeles County has been concentrating graphite from a disseminated ore, the product being used for paint and for foundry facing.

Graphite Production of California, by Years.

According to the records of the State Mining Bureau, the graphite production of California, by years, has been as follows:

Year	Pounds	Value
1901	128,000	\$4,480
1902	84,000	1,680
1903		
1913	2,500	25
1914		
1915		
1916	29,190	2,335
1917		
1918	*770,000	37,225
1919		
1920		
1921	*624,000	26,160
1922		
1923		
1925	*76,000	13,120
1926		
1927		
Totals	2,113,690	\$85,025

* Annual details concealed under 'Unapportioned,' on account of a single producer.

GYPSUM

Bibliography: State Mineralogist Reports XIV, XV, XVII, XVIII, XXII. Bulletins 38, 67, 91. U. S. Geol. Surv., Bull. 223, 413, 430, 697. U. S. Bur. of Standards, Circular No. 281.

During 1927 one operator each in Imperial and Kern counties and two in Riverside produced a total of 94,630 tons of gypsum, valued at \$292,090, compared with 114,868 tons and \$211,337 in 1926. The material was utilized mainly in cement manufacture as a retardant, for hard-wall plaster (including wall board), and for fertilizer.

Uses.

The most important use of gypsum from the quantity standpoint is in the calcined form where it is utilized in the manufacture of various hard-wall plasters and plaster board. As plaster of paris, it plays a very important part in surgical work. Approximately 2%, by weight, raw gypsum is added in the manufacture of Portland cement just before the final grinding. In this application, the gypsum acts as a retarder to the set of the cement. The use of gypsum tile for non-bearing fireproof partitions, stairway and elevator enclosures, and the protection of steel columns, girders and beams, has increased greatly.

Keene's cement is a gypsum product, calcined to complete dehydration, and an accelerator added such as alum, potassium sulphate, borax, aluminum sulphate.

Land plaster may be applied to the soil by drilling, or scattered in the hill, or it may be sowed broadcast, in quantities ranging from 200 to 500 pounds to the acre.

Total Production of Gypsum in California.

Production of gypsum annually in California since such records have been compiled by this Bureau is as follows:

Year	Tons	Value	Year	Tons	Value
1887	2,700	\$27,000	1909	30,700	\$138,176
1888	2,500	25,000	1910	45,294	129,152
1889	3,000	30,000	1911	31,457	101,475
1890	3,000	30,000	1912	37,529	117,388
1891	2,000	20,000	1913	47,100	135,050
1892	2,000	20,000	1914	29,734	78,375
1893	1,620	14,280	1915	20,200	48,953
1894	2,446	24,584	1916	33,384	59,533

LIMESTONE

Bibliography: State Mineralogist Reports IV, XII-XV (inc.), XVII-XXIII (inc.). Bulletins 38, 91. Oregon Agr. College, Extension Bulletin 305. Eng. and Min. Jour.-Press, Vol. 120, pp. 249-253.

'Industrial' limestone was produced in nine counties during 1927, to the amount of 699,790 tons, valued at \$663,957, being an increase both in quantity and value compared to the 1926 output of 108,795 tons, worth \$367,501.

The amount here given does not include the limestone used in the manufacture of cement nor for macadam and concrete, nor of lime for building purposes; but accounts for that utilized as a smelter and foundry flux, for glass and sugar making, and other special chemical and manufacturing processes. It also includes that utilized for fertilizers (agricultural 'lime'), 'roofing gravel,' paint and concrete filler, whitening for paint, putty, kalsomine, terrazzo, paving dust, chicken grit, carbon dioxide gas, 'paving compound,' facing dust for concrete pipe, also for rubber and magnesite mix. That from Santa Clara and Los Angeles counties is calcareous marl sold for agricultural purposes. Of the total product in 1927, approximately 23,183 tons, valued at \$41,096, were used for agricultural purposes.

Distribution of the 1927 output was as follows:

County	Tons	Value
El Dorado -----	96,733	\$146,506
San Bernardino -----	548,011	348,384
Santa Cruz -----	16,717	38,045
Tulare -----	21,774	77,000
Contra Costa, Los Angeles, Riverside, San Mateo, Shasta*-----	16,555	54,022
Totals -----	699,790	\$663,957

* Combined to conceal output of a single operator in each.

Limestone Production of California, by Years.

The following tabulation gives the amounts and value of 'industrial' limestone produced in California by years since 1894 when compilation of such records was begun by the State Mining Bureau. These tonnages consist principally of limestone utilized for flux, glass and sugar making, agricultural, chemical, and other special industrial purposes. That utilized in cement manufacture is not included.

Year	Tons	Value	Year	Tons	Value
1894 -----	15,420	\$19,275	1912 -----	613,375	\$570,248
1895 -----	71,355	71,690	1913 -----	301,918	274,455
1896 -----	68,184	71,112	1914 -----	572,272	517,713
1897 -----	36,796	38,556	1915 -----	146,324	156,288
1898 -----	27,686	24,548	1916 -----	187,521	217,733
1899 -----	30,769	29,185	1917 -----	237,279	356,396
1900 -----	32,791	31,532	1918 -----	208,566	456,258

LITHIA

Bibliography: State Mineralogist Reports II, IV, XIV, XXI, Bulletins 38, 67, 91.

Lithia mica, lepidolite (a silicate of lithium et al.) utilized in the manufacture of artificial mineral water, fireworks, glass, etc., has been mined in San Diego County since 1899, except between 1905 and 1915, though there was none shipped in 1923 and 1925. The 1927 figures are concealed under the 'Unapportioned' item. Some amblygonite, a lithium phosphate, is occasionally also obtained from pockets associated with the gem tourmalines.

Lithia mica total production in the state has been as follows:

Year	Tons	Value	Year	Tons	Value
1899.....	124	\$4,600	1919.....	800	\$14,400
1900.....	440	11,000	1920.....	10,046	153,502

MICA

Bibliography: State Mineralogist Reports II, IV. Bulletins 38, 67, 91. U. S. Geol. Surv., Bull. 740; Min. Res. of U. S. Eng. & Min. Jour.-Press, Vol. 115, pp. 55-60, Jan. 13, 1923.

No commercial production of mica has recently been reported in California. Production in previous years has been as follows:

Year	Tons	Value
1902.....	50	\$2,500
1903.....	50	3,800
1904.....	50	3,000
Totals	150	\$9,300

Classification and Uses.

Practically all marketable mica is of the muscovite or phlogopite varieties. There are three main commercial classes: Sheet mica, including punch; splittings, and scrap. Sheet mica is used chiefly for electrical purposes and for glazing; splittings are made into built-up mica; scrap is ground to a powder. Mica to be classified as sheet must yield a rectangle of at least $1\frac{1}{2} \times 2$ in., must split evenly and freely, be free from cracks, rulings, or plications, and reasonably free from inclusions of foreign matter, though stains of a nonconducting character are permissible for some uses. Ability to withstand heat and high electrical resistance have led to a wide application of sheet mica in the electrical industries. The electrical uses of sheet mica greatly exceed all others in quantity and value of the material used.

As a heat-resisting transparent medium, sheet mica has various uses. It is widely employed for stove windows, though this use has declined

to a considerable extent. A hard and rigid mica that is nearly clear is best suited for stove fronts. High-grade stove mica commands a higher price than electrical mica, because for the most part larger sizes are demanded. Mica is also used in furnace and bake-oven sight-holes, heat screens, lamp chimneys, canopies and shades, particularly for gas mantles, and also for military lanterns and in lantern slides.

Its ability to withstand shocks and strains, combined with its transparency, has led to wide use in motor goggles, spectacles, divers' helmets, smoke helmets, compass cards, gage fronts, and in windows subject to shock, as in the conning towers of warships. On account of its heat-resisting qualities, ground mica is used in railroad car axle packings, in pipe and boiler coverings, in fire-proof paints, and in rubber tires. Ground mica is used as a component in roofing, as a filler in rubber and other products, in calico printing, and as a tire powder. It is used also in tinsel decorations, and as 'Santa Claus snow' for Christmas tree and window decorations. It is used as a lubricant for wooden bearings, and mixed with oil for metal bearings.

MINERAL PAINT

Bibliography: State Mineralogist Reports XII-XIX (inc.), XXI, XXII. Bulletins 38, 91.

Mineral paint material was produced in California in 1927 by a single operator in Stanislaus County. This material was a yellow ochre. There was a slight decline in both quantity and value from the 1926 production.

Mineral Paint Production of California, by Years.

The first recorded production of mineral paint materials in the state was in the year 1890. The output, showing annual amount and value since that time, is given herewith:

Year	Tons	Value	Year	Tons	Value
1890.....	40	\$480	1910.....	200	\$2,040
1891.....	22	880	1911.....	186	1,184
1892.....	25	750	1912.....	300	1,800
1893.....	590	26,795	1913.....	303	1,780
1894.....	610	14,140	1914.....	132	847
1895.....	750	8,425	1915.....	311	1,756
1896.....	395	5,540	1916.....	643	3,960

MINERAL WATER.

Bibliography: State Mineralogist Reports VI, XII-XVIII (inc.), XXI-XXIII (inc.). U. S. G. S., Water Supply Paper 338. Min. Res. 1914, 1916. 'Mineral Springs and Health Resorts of California,' by Dr. Winslow Anderson, 1890. U. S. Dept. of Agr., Bur. of Chem., Bulletin 91.

A widespread production of mineral water is shown annually in California. These figures refer to mineral water actually bottled for sale, or for local consumption. Water from some of the springs having a special medicinal value brings a price many times higher than the average shown, while in some cases the water is used merely for drinking purposes and sells for a nominal figure. Health and pleasure resorts are located at many of the springs. The waters of some of the hot springs are not suitable for drinking, but are very efficacious for bathing.

From a therapeutic standpoint, California is particularly rich in mineral springs. The counterparts of many of the world-famed spas of Europe and the eastern United States can be found here. Radioactivity has been noted in at least three localities in California: At The Geysers in Sonoma County, Arrowhead Hot Springs in San Bernardino County, and Paraiso Springs, Monterey County. It doubtless exists at others, but the State Division of Mines and Mining has not as yet had funds available to conduct the necessary investigations along this line.

So far as the efficacy of radioactivity in mineral water is concerned, it has been found by investigations of the U. S. Geological Survey and the U. S. Department of Agriculture that it is not retained and transported in bottled water. Radioactivity in water is only temporary, and dissipates. To obtain whatever therapeutic effect it may possess, radioactive water should be utilized directly at the spring.

Commercial production of mineral water in California for 1927 amounted to a total of 16,644,423 gallons, valued at \$1,487,183, being a new high record in quantity and value over all previous years. The 1927 output was distributed by counties, as follows:

County	Gallons	Value
Lake -----	45,643	\$51,149
Los Angeles -----	3,931,525	260,198
Napa -----	81,864	50,116
San Diego -----	109,685	51,559
Sonoma -----	25,428	5,889
Butte, Contra Costa, Calaveras, Fresno, Marin, Riverside, San Bernardino, San Luis Obispo, Santa Barbara, Santa Clara, Siskiyou, Solano * -----	12,450,278	1,068,272
Totals -----	16,644,423	\$1,487,183

* Combined to conceal output of a single operator in each.

The production above tabulated was in part bottled with artificial carbonation, in part natural and a large part was used in the preparation of soft drinks with flavors.

Although some of the operators complain that prohibition has all but killed off the mineral water business, the reports of actual produc-

tion of mineral water bottled and sold indicate an encouraging growth and a material increase annually both in total quantity and value, as may be noted from the tabulation below.

Mineral Water Production of California, by Years.

Mineral water was bottled for sale, at the Napa Soda Springs, Napa County, as early as 1860, and at other springs in California, notably The Geysers, Sonoma County, also at early dates; but there are no figures available earlier than the year 1887. Amounts and values, annually, since that year are shown herewith:

Year	Gallons	Value	Year	Gallons	Value
1887	618,162	\$144,368	1909	2,449,834	\$465,488
1888	1,112,202	252,990	1910	2,335,259	522,009
1889	808,625	252,241	1911	2,637,669	590,654
1890	258,722	89,786	1912	2,497,794	529,384
1891	334,553	139,959	1913	2,350,792	599,748
1892	331,875	162,019	1914	2,443,572	476,169

PHOSPHATES

Bibliography: State Mineralogist Report XXI. Bulletins 67, 91.

No commercial production of phosphates has been recorded from California, though occasional pockets of the lithium phosphate, amblygonite, Li (AlF) PO_4 , have been found associated with the gem tourmaline deposits in San Diego County. Such production has been classified under lithia.

PUMICE and VOLCANIC ASH

Bibliography: State Mineralogist Reports XII, XIV, XV, XVII, XVIII, XXII. Bulletin 38 (See 'Tufa').

The production of pumice and volcanic ash for the year 1927 amounted to 13,779 tons valued at \$168,896, and came from properties in Fresno, Imperial, Inyo, Kern, Mono, and San Luis Obispo counties. In 1927 an increase both in tonnage and value compared with the 1926 shipments, which were 7170 tons, worth \$48,350, although the 1927 figures include also production over the past four years from a deposit for which reports had not been previously received.

The material from Imperial County and part of that from Mono is of the vesicular, block variety and was sold for abrasive purposes; the balance of the Mono material and that from Fresno, Inyo, Kern and San Luis Obispo was the volcanic ash, or tuff variety, and was employed in making soap, cleanser compounds and a large tonnage is being utilized as a concrete filler in cement displacement. The Kern County ash is going into the preparation of one of the popular and nationally advertised brands of cleanser compounds..

Pumice Production of California, by Years.

Commercial production of pumice in California was first reported to the State Mining Bureau in 1909, then not again until 1912, since which year there has been a small annual output, as indicated by the following table:

Year	Tons	Value	Year	Tons	Value
1909.....	50	\$500	1920.....	1,537	\$25,890
1910.....			1921.....	406	6,310

PYRITES

Bibliography: State Mineralogist Reports XVIII, XIX, XXII. Bulletins 38, 91. Min. and Sci. Press, Vol. 114, pp. 825, 840.

A total production of 130,910 tons of pyrite, valued at \$564,823, was reported shipped in California during 1927, from properties in Alameda, Mariposa, Shasta and San Benito counties. This was an increase both in quantity and value over 100,896 tons, valued at \$466,088, in 1926. The material from San Benito County was an iron sulphate (not an iron sulphide), and that from Mariposa County contains both sulphide and sulphate, but used for the same purposes as some of the pyrite and therefore classed as pyrite.

The material was mostly used in the manufacture of sulphuric acid for explosives and fertilizers, but a portion was utilized directly in the preparation of agricultural fertilizer and insecticide. The sulphur content ranged up to 46.5% S.

This does not include the large quantities of pyrite, chalcopyrite, and other sulphides which are otherwise treated for their valuable metal contents. Some sulphuric acid is annually made as a by-product in the course of roasting certain tonnages of Mother Lode auriferous concentrates while under treatment for their precious metal values.

Pyrites Production in California, by Years.

The total recorded pyrites production in California to date is as follows:

Year	Tons	Value	Year	Tons	Value
1898	6,000	\$30,000	1914	79,267	\$230,058
1899	5,400	28,620	1915	92,462	293,148
1900	3,612	21,133	1916	120,525	372,969
1901	4,578	18,429	1917	111,325	323,704
1902	17,525	60,306	1918	128,329	425,012
1903	24,311	94,000	1919	147,024	510,300
1904	15,043	62,992	1920	146,001	530,581

SHALE OIL

Bibliography: State Mineralogist Report XIX. U. S. Geol. Surv., Bulletins 322, 729. U. S. Bur. of Mines, Bull. 210. Eng. and Min. Jour.-Press, Vol. 118, No. 8, pp. 290-292, Aug. 23, 1924. Chem. & Met. Eng., Vol. 32, No. 6, Feb., 1925. Min. Congress Jour., Dec., 1924.

Oil Shale is defined by Gavin,¹ as follows:

"Oil shale is a compact, laminated rock of sedimentary origin, yielding over 33 per cent of ash and containing organic matter that yields oil when distilled, but not appreciably when extracted with the ordinary solvents for petroleum.

* * * * *

"Oil shales contain a substance, or substances, usually classed as a pyro-bitumen, that by destructive distillation, or pyrolysis, yields oils somewhat similar to petroleum. These substances have been termed 'kerogen,' from two Greek words meaning producer of wax."

The Scottish oil shales are also known as 'torbanite.'

The so-called 'oil shales' of California do not for the most part conform to the above definition, as the greater part of the oil obtained from them occurs as such and can be extracted by suitable solvents. The most extensive deposits in this state are part of the Monterey formation of Tertiary age, and physically and chemically are different from the oil shales of Scotland and from other oil shales in the United States. The mineral matter of this shale is diatomaceous; the beds that yield oil occur in massive formation; and when freshly broken smell strongly of petroleum. Most geologists consider the Monterey shales to have been the origin of the oil in some of the oil fields of California.

Although the extraction of shale oil has been a matter of commercial practice on a considerable scale for many years in Scotland, France, and Australia, it has not attained any great commercial importance as yet in the United States. Technical knowledge of the subject, however, is increasing. With the gradual depletion of the underground reserves of liquid oil, it is merely a matter of time until the development of the oil shales of the United States will be an economic necessity.

¹ Gavin, M. J., Oil Shale, An Historical, Technical, and Economic Study: U. S. Bur. of Mines, Bull. 210, p. 26, 1924.

The selling price of petroleum will be the determining factor. The recovery of by-product ammonium sulphate is an important feature of the process.

Two plants on a more or less experimental scale have been in operation in California for several years past, with commercial production beginning in a small way in 1922. The product, in part, has been sold for utilization as a flotation oil in metallurgical work, and part has been consumed as fuel at the plants. As only one plant reported output for 1927, the value is concealed under the 'unapportioned' item.

SILICA (Sand and Quartz)

Bibliography: State Mineralogist Reports IX, XIV, XV, XVII, XVIII, XX-XXIII. Bulletins 38, 67, 91.

We combine these materials because of the overlapping roles of vein quartz which is mined for use in glass making and as an abrasive, and that of silica sand which, although mainly utilized in glass manufacture, also serves as an abrasive. Both varieties are also utilized to some extent in fire-brick manufacture.

A portion of the tonnage of vein quartz in California in 1916 and 1917 was employed in the preparation of ferro-silicon by the electric furnace. At present, some is utilized as a foundry flux, and for steel-casting molds. A portion of the silica sold (both sand and quartz) is also used in glazes for porcelain, pottery and tile, and in the body of the ware to diminish shrinkage; and some of the sand for the preparation of sodium silicate ('water glass'). Manufacturers of paint use finely ground silica, which forms as much as one-third of the total pigment in some paints. For certain purposes finely-ground crystalline material is superior in paints to other materials because of the angularity of the grains, which makes them adhere more firmly to the article painted and after wear afford a good surface for repainting. The same angularity makes artificially comminuted crystalline quartz superior to natural sand for use in wood fillers. It is also preferable for soaps and polishing powders. Part of the 1925 output was used for roofing and stucco-dash granules.

We do not include under this heading such forms of silica as: quartzite, sandstone, flint, tripoli, diatomaceous earth, nor the gem forms of 'rock crystal,' amethyst, and opal. Each of these has various industrial uses, which are treated under their own designations.

The production of silica in California in 1927 amounted to 24,636 tons, valued at \$94,762, from nine properties in five counties. This was a decrease from 30,010 tons valued at \$104,317 in 1926.

Of the above total 11,150 tons was of sand and 13,486 tons of vein and boulder quartz. For making the higher grades of glass, most of

the sand is imported from Belgium. Belgian sand has also displaced local material in the manufacture of sodium silicate ('water-glass'). There are various deposits of quartz in California which could be utilized for glass making, but to date they have not been so used owing to the cost of grinding and the difficulty of preventing contamination by iron while grinding.

Silica sand has been produced in the following counties of the state: Alameda, Amador, El Dorado, Los Angeles, Mono, Monterey, Orange, Placer, Riverside, San Diego, San Joaquin, and Tulare, the chief centers being Amador, Monterey and Los Angeles counties. The industry is of limited importance, so far, because of the fact that much of the available material is not of a grade which will produce first-class colorless glass; for such, it must be essentially iron-free. Even a fractional per cent of iron imparts a green color to the glass.

Total Silica Production of California.

Total silica production in California since the inception of the industry, in 1899, is shown below, being mainly sand:

Year	Tons	Value	Year	Tons	Value

SILLIMANITE—ANDALUSITE—CYANITE GROUP

Bibliography: State Mineralogist Report XX. Bulletins 67, 91. Dana's Mineralogy. U. S. Geol. Surv., Prof. Paper 110. Eng. & Min. Jour.-Press, Vol. 120, pp. 91-94, 1925. Amer. Mineralogist, June, 1924.

Sillimanite and andalusite are both aluminum silicates (Al_2SiO_5), having the same composition and formula, but with slightly different physical characteristics. Though both crystallize in the orthorhombic system, their crystal habits are different, andalusite being usually in coarse prismatic forms, the prisms nearly square in shape; also occurs massive, imperfectly columnar, and sometimes radiated and granular. Sillimanite commonly occurs in long, slender crystals, not distinctly terminated; prismatic faces striated and rounded; often in close parallel groups, passing into fibrous and columnar massive forms, sometimes radiating. Colors are similar. Hardness, andalusite 7.5, sillimanite 6-7. Andalusite is slightly lighter in specific gravity.

A massive deposit of andalusite, found in Dry Creek Canyon in the White Mountains of the Inyo Range, in Mono County, is being mined by the Clampton Porcelain Company of Detroit, Michigan. The

material is shipped East and utilized in the manufacture of porcelain for automobile spark plugs, for other high-tension electric insulators, laboratory ware and porcelain. Porcelain made from these minerals can be subjected to sudden and extreme changes in temperature without damage.

Cyanite is also an aluminum silicate (Al_2SiO_5), of the same chemical composition as andalusite and sillimanite, but crystallizing in the triclinic system. Occurs usually in long-bladed crystals, rarely terminated; hardness 5-7.25; gravity 3.56-3.67 (being heavier than the other two); color, blue. A deposit of cyanite, apparently in quantity, is being developed in Imperial County, near Ogilby, and shipments made to a refractory plant in Los Angeles.

Dumortierite, though differing somewhat in composition from the above, being a basic aluminum silicate ($4 \text{ Al}_2\text{O}_3 \cdot 3 \text{ SiO}_2$), has proved similar in behavior in ceramic work so that it is now being mixed with andalusite for electrical porcelains. A deposit of this mineral in Nevada is being mined for that purpose. Occurrences of massive dumortierite are known in Imperial County in this state and there may yet be some commercial possibilities for them.

SOAPSTONE and TALC

Bibliography: State Mineralogist Reports XII, XIV, XV, XVII-XXIII. Bulletins 38, 67, 91. U. S. Bur. of Mines, Bulletin 213. Rep. of Investigations, Serial No. 2253, May, 1921.

The total output of talc and soapstone in California in 1927 amounted to 16,218 tons, valued at \$164,744, compared with 17,004 tons, valued at \$255,645 in 1926. Nearly 80 per cent of the product was high-grade talc from Inyo, San Bernardino and Shasta counties, which material was utilized mainly in toilet powders, paint, paper, and rubber manufacture, and some in ceramics, the remaining coming from a single producer each in Butte, Calaveras and El Dorado counties.

The 'soapstone' grades were used mainly for roofing granules and as a filler in roofing paper, and part also in magnesite cement.

It is reported that California talc is steadily replacing imported talc in the toilet trade on the basis of quality. The largest production of talc in the United States comes from Vermont and New York, and of massive soapstone from Virginia.

Composition and Varieties.

Talc is hydrous magnesium silicate with the chemical formula $\text{H}_2\text{Mg}_3(\text{SiO}_3)_4$. It is also called soapstone and steatite. The term 'talc' properly includes all forms of the pure mineral, whereas 'steatite'

8-62279

denotes particularly the massive, compact variety, and 'soapstone' the impure, massive forms containing as low as 50% of talc. When pure, talc is soft, having a hardness of 1, but impurities increase the hardness up to 3 or 4. The color varies from pure white and silvery white through gray, green, apple green, to dark green, also yellow, brown, and reddish when impure. It is commonly compact or massive, or in fine granular aggregates, and often in foliated plates or in fibrous aggregates.

Uses.

Although the uses of talc and soapstone are many and varied, some of them are not in general well known nor fully developed; and although few of their uses can justly be considered essential in the sense that no substitute can be used, there are several which are of great importance. The widest use of talc is in the powdered form, and the value depends upon color (whiteness), uniformity, fineness of grain, freedom from grit, 'slip,' and sometimes freedom from lime. The white varieties, free from grit and iron, low in lime, ground to 200-mesh and finer, are largely used as a filler for paper, rubber and paint, and the very highest grade as toilet powder. Ground talc is also used in dressing and coating cloth, in making soap, rope, twine, pipe-covering compounds, heavy lubricants, and polishes, and as a filler in concrete to make it waterproof. Ground talc and soapstone are used for foundry facings, either alone or mixed with graphite and a coarser grade is used in the manufacture of asphalt-coated roofing felts and papers, both as a filler and as a surfacing. Massive close-grained talc, free from iron and grit, is cut into blanks and baked, forming the material used for gas tips and electrical insulation, commonly known as 'lava.' Its hardness, its resistance to heat, acids and alkalis, and its great dielectric strength make it very useful for electric insulation, and no satisfactory substitute for it has been found.

Massive varieties of talc, pyrophyllite, and high grades of soapstone are cut into slate pencils and steel-workers' crayons. 'French chalk' or 'tailor's chalk' is a soft, massive talc. In China, Japan and India, massive talc (steatite) is carved into grotesque images and other forms, and is often sold as imitation jade. Soapstone is cut into slabs of 1 and 2 inches in thickness and sold as griddles, footwarmers, and fireless-cooker stones, or fabricated into laundry sinks and tubs, laboratory-table tops, hoods, tanks and sinks, electric switchboards, and for other uses in which the properties of resistance to heat, acids and alkalis, and electricity are essential.

Imports.

Foreign importations of high-grade white talc suitable for the manufacture of toilet powder have come mainly from Canada, Italy and France. Foreign producers have the benefit of cheap labor, and a low tariff import duty. In addition to these disadvantages, California operators have to contend with transcontinental freight rates to the eastern manufacturing centers. In 1927 importations totaled 25,123 short tons, valued at \$545,285, compared with 24,346 tons, valued at \$563,799 in 1926, according to the United States Bureau of Foreign and Domestic Commerce.

Talc Production of California, by Years.

Production was intermittent in the state up to 1912; but there has been a material growth since 1916, as shown in the following table:

Year	Tons	Value	Year	Tons	Value
1893.....	400	\$17,750	1912.....	1,750	\$7,350

1911.....					

STRONTIUM

Bibliography: Bulletins 67, 91. U. S. G. S., Bull. 540; 660-I.

There has been no production of strontium minerals in California since 1918, though in that year both celestite (SrSO_4), and the carbonate, strontianite (SrCO_3) were shipped. The first recorded commercial output of strontium minerals in California was in 1916. The occurrence of the carbonate is particularly interesting and valuable, as it appears to be the only considerable deposit of commercial importance so far opened up in the United States. Shipments reported as averaging 80% SrCO_3 have been made. The deposit is associated with deposits of barite, near Barstow, San Bernardino County. The carbonate has also been found in massive form near Shoshone, Inyo County. In addition to Imperial County, celestite is found near Calico and Ludlow, and in the Avawatz Mountains in San Bernardino County, but as yet undeveloped.

Production of strontium minerals in California, by years, has been as follows:

Year	Tons	Value
1916.....	57	\$2,850
1917.....	3,050	37,000
1918.....	2,900	33,000
1919.....		
Totals.....	6,007	\$72,850

The principal use for strontium in the United States is in the form of the nitrate in the manufacture of red flares, or Costen and Bengal lights and fireworks. It is imported mainly from Germany and England. In Germany and Russia, strontium in the form of the hydroxide is used in the manufacture of beet sugar. It is stated that strontia is more efficient and satisfactory in that process than lime, as it gives an additional recovery of 6% to 8%.

Of the two minerals, strontianite (carbonate) and celestite (sulphate), the carbonate is the more desirable as it is easier to convert to other salts; but it is scarcer. Celestite is found with limestone and sandstone and is sometimes associated with gypsum. Strontianite is also found with limestone, but associated with barite and calcite.

SULPHUR

Bibliography: State Mineralogist Reports IV, XIII, XIV. Bulletins 38, 67, 91.

In 1923-1924 there was a small production of sulphur, from a single property in Kern County. It was ground, and utilized as a fertilizer and in dusting for mildew. This was the first commercial output of native sulphur in California for many years although this mineral has been found to some extent in Colusa, Imperial, Inyo, Kern, Lake, Sonoma, Tehama, and Ventura counties.

Sulphur was produced at the famous Sulphur Bank mine in Lake County, during the years 1865-1868 (inc.), totaling 941 tons, valued at \$53,500; following which the property became more valuable for its quicksilver. The Elgin quicksilver mine, near Wilbur Springs, Colusa County, is a similar occurrence.

The principal sources in the United States are the stratified deposits in Louisiana and Texas, extraction being accomplished by a unique system of wells with steam pipes. It is stated that three large companies operating there are capable of producing more than 1,000,000 tons annually in excess of our normal consumption in the United States, which averages about 600,000 tons. The mines at Freeport, Texas, are in a peculiarly favorable location in that they are practically at tidewater.

Formerly considerable sulphur was imported from Italy and from Japan; but the situation is now reversed, so that in 1927, a total of 789,371 long tons, valued at \$16,269,254, was exported from the United States, principally to Europe and Canada, also Australia, New Zealand, Mexico and South America.

CHAPTER SIX

SALINES

Bibliography: State Mineralogist Reports III, XIV, XV, XVII-XXIII (inc.). Bulletin 24. Spurr and Wormser, "Marketing of Minerals." "Non-Metallic Minerals," by R. B. Ladoo. See also under each substance.

Under this heading are included borax, common salt, soda, potash, and other alkaline salts. The first two have been produced in a number of localities in California, more or less regularly since the early sixties. Except for a single year's absence, soda has had a continuous production since 1894. Potash, magnesium chloride and sulphate, and calcium chloride have been added to the commercial list in recent years, and in 1926 joined by bromine. The nitrates are still prospective.

Our main resources of salines are the lake beds of the desert regions of Imperial, Inyo, Kern, Los Angeles, San Bernardino, and San Luis Obispo counties, and the waters of the Pacific Ocean.

The total value of this group shows an increase to \$7,350,892 in 1927 over the 1926 figure of \$5,458,593 as detailed in the following tabulation:

Substance	1926		1927		Increase + Decrease— Value
	Tons	Value	Tons	Value

BORATES

Bibliography: State Mineralogist Reports III, X, XII-XV (inc.), XVII-XXIII (inc.). Bulletins 24, 67, 91.

During 1927 there was produced in California a total of 89,093 tons of borate materials compared with 84,101 tons for the year 1926. The material shipped during the year included crude and select colemanite ore from Inyo County, the new sodium borates, kernite (Rasorite) and kramerite from Kern County; also crystallized borax prepared by evaporation of brines at Searles Lake in San Bernardino County.

As the crude ore is not sold as such, but is almost entirely calcined before shipping to the refinery for conversion into the borax of commerce, and because of the fact that the material varied widely in boric acid content, we have recalculated the tonnage to a basis of 40% A.B.A. This is approximately the average A.B.A. content of the colemanite material after calcining, and also of the crystallized borax obtained from evaporation of the lake brines.

Recalculated as above, the 1927 production totals 72,462 tons, valued at \$3,043,260, an increase over the similar figures for 1926, which were 47,605 tons and \$1,625,298.

Colemanite is a calcium borate, and the material mined is shipped to seaboard chemical plants for refining. The latest development in the borax industry is the finding in quantity and opening up of a new borate mineral which bids fair to supplant colemanite in much the same way that the colemanite deposits displaced the borax industry in the desert playas or dry lakes, some forty years ago. This new mineral is 'kernite' (or 'rasorite'), a sodium borate with a smaller water-of-crystallization content than the 'borax' of commerce, so that when re-crystallized to borax, the resulting product has an increased weight over the original material. These deposits are being opened up by the Pacific Coast Borax Company in southeastern Kern County.

Refined 'borax' (sodium tetraborate) is used in making the enameled coating for cast-iron and steelware employed in plumbing fixtures, chemical equipment, and kitchen utensils. It is also a constituent of borosilicate glasses which are utilized in making lamp chimneys, baking dishes, and laboratory glassware. Other important uses of borax are in the manufacture of laundry and kitchen soaps, in starch, paper sizing, tanning, welding, and in the preparation of boric acid, which is employed as an antiseptic and in preserving meats. Among the newer uses for borax is its employment in the preserving of citrus fruits by washing them in a solution of borax, which closes the pores of the skin. The application of this process is increasing in California and Florida. Another is as a preservative of wood, in addition to which borax, being non-inflammable, renders it fireproof.

An increased foreign demand stimulated an increased production of this material. The total amount exported from the United States was 36,954 short tons valued at \$2,422,144 compared with 14,305 short tons valued at \$1,256,798 in 1926. From one California port in 1927 approximately 22,000 short tons of borax was shipped to the United Kingdom and continental Europe.

California deposits are the most important source of borax in the world, and that this material can be mined and refined at a low cost, supplying an increasing market, is shown in the following article taken from the *ENGINEERING AND MINING JOURNAL*:¹

"New aspects in the present situation of the borax industry have been disclosed by an authority as the result of the recent development of important new deposits of borate minerals in the Kramer district in southeast Kern County, California.

"The new mine that has been opened by the Pacific Coast Borax Company in the northwest corner of Sec. 24, T. 11 N., R. 8 W., and the extreme northwest corner of Sec. 19 of the township next adjoining on the east, is apparently now on regular production, with railroad connections established and shipping the new kernite ore in large quantities. The present output of borate ores or products in the United States is approximately as follows:

		<i>Average daily shipment</i>
Pacific Coast Borax Co. mine near Kramer, Cal.	200 tons crude kernite ore of high purity	
American Trona Corp., Searles Lake, Cal.	140 tons refined borax	
West End Chemical Co. mine near Las Vegas, Nev.	25 tons calcined colemanite	
West End Chemical Co. plant at Searles Lake, Cal.	15 tons refined borax	
Total daily production.....	380 tons	

"The total production represented by these averages, if they are maintained throughout this year, will be approximately 140,000 tons of borax for 1928, which is probably approximately the amount of present market requirements.

"The new source of borate mineral at Kramer is probably the most available source of borax that the world has ever known, in quality of material, massiveness, purity, minability of the deposit, and accessibility. The new mineral kernite apparently exists under extremely favorable mining conditions, so that the ore can apparently be brought to the surface at a cost of less than \$10 a ton. It may be recalled that the kernite ore recovered in such pure form as indicated by the present operations should yield more than its equivalent in weight of commercial borax, and that

¹ Engineering and Mining Journal, Mar. 31, 1928, p. 551.

only the simplest refining processes are required to transform the crude material as mined into the commercial product. Therefore it is entirely likely that the cost of borax may be cut from recent quotations, which have ranged around four cents a pound, to one-half that amount or even less.

"Another interesting factor may also have an important influence in the production situation and marketing of this product. It appears that an important extension of the richest part of these deposits lies south of the property now being operated, and this new deposit is evidently under independent control. The discovery was made by borings and is situated about three-quarters of a mile southwest of the original shaft in the northeast corner of Sec. 24. According to authentic information, these borax deposits revealed a thick section of particularly pure kernite in the new area referred to, and a mining shaft is being rapidly sunk to develop this new deposit. The material which may be developed from this independent operation promises to exert an important influence with the Kramer district."

Total Production of Borate Materials in California.

Borax was first discovered in California in the waters of Tuscan Springs in Tehama County, January 8, 1856. Borax Lake in Lake County was discovered in September of the same year by Dr. John A. Veach. This deposit was worked in 1864-1868, inclusive, and during that time produced 1,181,365 pounds of refined borax. The bulk of it was exported by sea, to New York. This was the first commercial output of this salt in the United States, and California is still today the leading American producer of borax, having been for many years the sole producer.

Production from the dry lake 'playa' deposits of Inyo and San Bernardino counties began in 1873; but it was not until 1887 that the borax industry was revolutionized by the discovery of the colemanite beds at Calico, in San Bernardino County, and later similar beds in Inyo and Los Angeles counties. The colemanite deposits of Ventura County are at present unworked, owing to lack of transportation facilities. Some production of colemanite has been made from deposits opened up in Clarke County, Nevada.

The total production of borate materials in California is shown in the following table:

Year	Tons	Value	Year	Tons	Value
1864	12	\$9,478	1897	8,000	\$1,080,000

■ Refined borax. ■ Recalculated to 40% 'anhydrous boric acid' equivalent beginning with 1922.

BROMINE

The first commercial production of bromine and bromine compounds was begun during 1926 by the California Chemical Corporation in its plant at Chula Vista, San Diego County, from salt-works bittern waters. This same plant has been recovering magnesium chloride for a number of years. A small amount of bromine was also reported made at the similar bittern-water plant of the Industrial Chemical Company at Newark, Alameda County. The amounts and values of this first and second years' yields of bromine in California are concealed under the 'Unapportioned' item.

A large part of the bromine output of the United States is not sold as bromine, but in the form of potassium and sodium bromides and other salts. The principal production in the United States has come from bitterns from salt wells in Michigan, Ohio and West Virginia.

The best known uses of bromine are its application in the form of silver bromide in photography and the manufacture of ethyl gasoline. Bromine, as such, was used extensively in the European War in making asphyxiating gases. It also has some uses in medicine, particularly in the treatment of nervous diseases.

CALCIUM CHLORIDE

Bibliography: U. S. Geol. Surv., Min. Res. 1919, Pt. II. Engineering and Contracting, Roads & Streets monthly issue, Feb. 6, 1924. 'How to Maintain Roads,' manual of instruction of Dow Chemical Company.

Calcium chloride is hygroscopic, that is, it has an affinity for water. This property is taken advantage of by utilizing this salt as a drying agent. It is also sprinkled on dirt roads and playgrounds to keep down dust by absorbing moisture. In refrigerating machinery for ice factories, meat-packing houses and cold-storage warehouses, a calcium-chloride solution is stated to have some advantages over salt brine. In fire buckets this solution has an advantage over pure water, in that it has a lower freezing point, does not corrode metal, and tends to keep the buckets full due to its absorbing moisture from the atmosphere. Powdered calcium chloride is used in drying gases, fruits and vegetables.

Total Calcium Chloride Production of California.

Commercial production of calcium chloride in California was first reported to the State Mining Bureau in 1921, from two plants in San Bernardino County, being obtained as a by-product in the refining of salt from deposits in certain of the desert dry lakes. In 1922-1924, there was only a single operator, so that the annual details are concealed under the 'unapportioned' item.

MAGNESIUM SALTS

Bibliography: State Mineralogist Reports XX, XXI. Bulletin 91. 'Dictionary of Applied Chemistry,' by Thorpe. U. S. Geol. Surv., Min. Res. of U. S.

The 1927 production of magnesium salts in California is concealed under 'unapportioned.' This was nearly all chloride, sold for use in magnesite stucco and cement mixtures (Sorel cement), also some for 'road liquor.' It was in part marketed in the liquid form testing 34°-36° Baumé, and in part as dry crystals, and was prepared from residual bitters at salt plants in Alameda and San Diego counties. The sulphate marketed was utilized for medicinal and bath purposes.

With the use of magnesite cement and stucco coming more into prominence in building construction on the Pacific Coast, the demand for magnesium chloride is increasing here; but the domestic article has to meet the competition of the cheaper, imported German chloride.

The average value reported for the chloride produced in California in 1927 was approximately \$19 per ton, f. o. b. plant.

Total Production of Magnesium Salts in California.

Commercial production of magnesium chloride in California was begun in 1916 by some of the salt companies, from the residual bitters obtained during the evaporation of sea water for its sodium chloride. In addition, some magnesium sulphate, or 'epsom salts' is also made, annually, but in smaller amount.

The total production of magnesium salts in California, since the beginning of the industry here, is shown in the following tabulation:

Year	Tons	Value
1916	851	\$6,407
1917	1,084	34,973
1918	1,008	29,955
1919	1,616	82,457
1920	3,150	107,787

NITRATES

Bibliography: State Mineralogist Report XV. Bulletins 24, 67, 91. U. S. G. S., Press Bulletin No. 373, July, 1918. Smithsonian Inst., Publ. No. 2421, 1916.

Nitrates of sodium, potassium and calcium have been found in various places in the desert regions of the state, but no deposit of commercial value has been developed as yet. It is hoped that a closer search may some day be rewarded by workable discoveries. At present the principal commercial source of nitrates is the Chilean saltpeter (sodium nitrate) deposits in South America.

The fixation of atmospheric nitrogen electrically has been accomplished successfully in Germany and Scandinavia. The possibilities of cheap hydro-electric power in California make the subject one of

interest to us, as we have also the natural raw materials and chemicals to go with the power. Sodium and potassium cyanides can be made by fixation of atmospheric nitrogen electrically.

POTASH

Bibliography: State Mineralogist Reports XV, XVIII, XX, XXII. Bulletins 24, 67, 91. U. S. G. S., Min. Res. 1913, 1914, 1915. Senate Doc. No. 190, 62d Congress, 2d Session. Mining & Sci. Press, Vol. 112, p. 155; Vol. 114, p. 789. Eng. & Min. Jour.-Press, Vol. 117, p. 557, Apr. 5, 1924.

During 1927, a total of 67,340 tons of potash salts of all grades was produced in California, valued at \$1,952,852, compared with 32,884 tons and \$812,285 in 1926. This was in part chloride and part from distillery slops char. The quality of the product averaged 60% equivalent K_2O content; and the material was sold principally for fertilizer manufacture.

Imports of crude potash minerals and salts into the United States in 1927, according to the U. S. Bureau of Foreign and Domestic Commerce, amounted to 623,109 long tons, valued at \$13,423,925, compared with 815,715 tons and \$14,122,699 in 1926. These materials consisted mainly of 'manure salts,' crude chloride (muriate) and sulphate, and kainite, all of which are admitted duty-free.

Quotations have recently ranged from \$46 per ton c.i.f. Atlantic and Gulf ports, for high-grade sulphate (90%-95%), to \$35 per ton for muriate (80%-85%), and \$19 for manure salts (30%).

Other uses for potash salts, besides those noted above, are in the manufacture of the best liquid soap and some higher-grade cake soaps, of some finer grades of glass, and in matches. The chemical requirements include tanning, dyeing, metallurgy, electroplating, photography and medicine.

Total Production of Potash in California.

Potash production began commercially in California in 1914, with a small yield from kelp. The bulk of the output comes from deposits of potash-bearing residues and brines in the old lake beds of the desert regions, particularly Searles Lake, San Bernardino County. A small amount is made annually from salt-works bitterns, and for a time there was some from Portland cement dust. Some also is obtained from molasses distillery-slops char.

The annual amounts and value of these potash materials, since their beginning in California in 1914, are shown by the following table:

Year	Tons	Value
1914	10	\$460
1915	1,076	19,391
1916	17,908	663,605
1917	129,022	4,202,889
1918	49,381	6,808,976
1919	28,118	2,415,963
1920	26,298	1,465,463
1921	14,806	390,210
1922	17,776	584,388
1923	29,597	709,836
1924	33,107	747,407
1925	36,355	829,770
1926	32,884	812,285
1927	67,340	1,952,852
Totals	483,678	\$21,609,495

SALT

Bibliography: State Mineralogist Reports II, XII-XV (inc.), XVII-XXIII (inc.); Bulletins 24, 67, 91. U. S. Geol. Surv., Bull. 669. U. S. Bur. of Mines, Bull. 146.

Most of the salt production in California is obtained by evaporating the water of the Pacific Ocean, plants being located on the shores of San Francisco, Monterey, and San Diego bays, and at Long Beach. Additional amounts are derived from lakes and lake beds in the desert regions, mainly in Kern and San Bernardino counties. A small amount of valuable medicinal salts is obtained by evaporation of the water of Lake Mono, Mono County.

Distribution of the 1927 salt production of California, by counties, was as follows:

<i>County</i>	<i>Tons</i>	<i>Value</i>
Alameda -----	180,623	\$366,346
Kern -----	14,960	69,839
Los Angeles, Modoc, Mono,* Monterey, San Bernardino, San Diego, San Mateo* -----	67,445	202,942
Totals -----	263,028	\$639,127

* Combined to conceal output of a single operator in each.

* Medicinal salts.

The above returns show a decrease both in tonnage and value from the figures of 1926, which were 311,761 tons and \$1,124,978. There were eight plants operating in Alameda County in 1927, and a total of nine in the other counties tabulated:

Production of Salt in California, by Years.

Amount and value of annual production of salt in California from 1887 is shown in the following tabulation:

<i>Year</i>	<i>Tons</i>	<i>Value</i>	<i>Year</i>	<i>Tons</i>	<i>Value</i>
1887 -----	28,000	\$112,000	1909 -----	155,680	\$414,708
1888 -----	30,800	92,400	1910 -----	174,920	395,417

SODA

Bibliography: State Mineralogist Reports XII, XIII, XV, XVII, XVIII, XX; Bulletins 24, 67, 91. U. S. Geol. Surv., Bull. 717.

The production of sodium salts in California in 1926 included: soda ash, caustic soda and bicarbonate from plants at Owens Lake, Inyo

county and trona ('sesqui-carbonate,' a double salt of Na_2CO_3 and NaHCO_3) from Searles Lake, San Bernardino County. There were no shipments of salt cake (sulphate) from the Carrizo Plains, San Luis Obispo County in 1927. The total amounted to 62,571 tons, valued at \$1,478,239, being a slight decrease in quantity but an increase in value compared with the 1926 figures of 63,333 tons and \$1,305,802.

The dense ash and bicarbonate were used mainly in the manufacture of soap, glass, sugar refining, and chemicals; and the trona for metallurgical purposes.

Sodium compounds to some extent replace potassium compounds, in glass and soap making, in photography, in match making, in tanning, sugar refining, and in the manufacture of cyanide for extracting gold and silver from their ores.

Soda Production of California, by Years.

The total output, showing amount and value of these materials in California since the inception of the statistical records of the State Mining Bureau, is given in the table which follows:

Year	Tons	Value	Year	Tons	Value
1894.....	1,530	\$20,000	1912.....	7,200	\$37,094
1895.....	1,900	47,500	1913.....	1,861	24,936

CHAPTER SEVEN

BY COUNTIES

Introductory.

The State of California includes a total area of 158,297 square miles, of which 155,652 square miles are of land. The maximum width is 235 miles, the minimum 148 miles, and the length from the northwest corner to the southeast corner is 775 miles. The state is divided into fifty-eight counties. The 1920 census figures show a total population for California of 3,437,709. A 1927 estimate by the State Controller places the figure that year at 5,398,457. Minerals of commercial value exist in every county, and during 1927 some active production was reported to the State Division of Mines and Mining from all of the fifty-eight.

Rank of Counties in Mineral Yield, 1927.

Of the first ten counties, in point of total output for 1927, the first four, Los Angeles, Kern, Orange, Ventura, owe their position mainly to petroleum, as does also Fresno (sixth). Los Angeles, due to its oil, leads all the others, being credited with 36% of the entire state's total value for 1927, having passed Kern in 1923, which led for many years. San Bernardino (fifth) owes its place chiefly to cement, silver, potash, borax, mineral water, and tungsten; Riverside (seventh) to cement, stone, brick and tile; Yuba (eighth) to gold; Santa Cruz (ninth) to cement; Plumas (tenth) to copper. Twenty-four counties have each a total in excess of a million dollars in 1927. Cement is an important item in nine of these counties, gold in four, and miscellaneous stone, granite, and soda in one each. In the point of variety and diversity, San Bernardino County led all others in 1927, with a total of 23 different mineral products on its commercial list, followed by Los Angeles with 20; San Diego with 19; Kern and Riverside with 17 each; Inyo with 13; Butte, 12; Calaveras, Monterey, Santa Barbara and Shasta with 11 each. The counties with their mineral resources, production for 1927, etc., are considered in detail in the following paragraphs.

County	Value	County	Value
1. Los Angeles -----	\$131,832,441	31. Mariposa -----	\$499,878
2. Kern -----	64,729,488	32. Tulare -----	474,173
3. Orange -----	60,547,041	33. Tuolumne -----	432,416
4. Ventura -----	30,995,379	34. Napa -----	417,229
5. San Bernardino -----	16,140,703	35. Stanislaus -----	393,089
6. Fresno -----	7,547,216	36. Merced -----	366,873
7. Riverside -----	6,543,369	37. Placer -----	360,224
8. Yuba -----	3,679,632	38. Monterey -----	351,049
9. Santa Cruz -----	3,473,209	39. Imperial -----	350,977
10. Plumas -----	3,260,723	40. Butte -----	308,139
11. Santa Barbara -----	2,699,296	41. Siskiyou -----	298,946
12. Alameda -----	2,577,787	42. San Luis Obispo -----	295,030
13. Inyo -----	2,519,834	43. Sonoma -----	265,392
14. Sacramento -----	2,348,916	44. El Dorado -----	245,435
15. Nevada -----	2,213,709	45. Mono -----	102,187
16. Amador -----	2,207,798	46. Lake -----	85,048
17. Contra Costa -----	2,172,756	47. Glenn -----	63,869
18. Shasta -----	1,950,088	48. San Francisco -----	62,700
19. San Benito -----	1,901,854	49. Modoc -----	62,251
20. San Mateo -----	1,863,838	50. Del Norte -----	53,975
21. San Diego -----	1,619,431	51. Lassen -----	49,425
22. Calaveras -----	1,608,714	52. Mendocino -----	47,670
23. Solano -----	1,557,840	53. Yolo -----	17,895
24. Madera -----	1,059,666	54. Colusa -----	13,207
25. Santa Clara -----	990,876	55. Tehama -----	5,350
26. Sierra -----	752,533	56. Alpine -----	5,306
27. San Joaquin -----	711,965	57. Kings -----	1,599
28. Humboldt -----	562,802	58. Sutter -----	300
29. Trinity -----	555,854		
30. Marin -----	527,004	Total -----	\$366,781,394

ALAMEDA

Land area: 732 square miles.

Population: 344,177 (1920 census).

Location: East side of San Francisco Bay.

Alameda County, while in no sense one of the 'mining counties,' comes twelfth on the list with a value of mineral products for 1927 of \$2,577,787, a decrease from the 1926 total, which was \$3,158,474.

The mineral resources of this county include asbestos, brick, chromite, clay, coal, copper, gold, limestone, quartz crystals, glass-sand, sandstone, silver, soapstone, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick and hollow building tile-----		\$587,402
Clay (pottery)-----	6,593 tons	20,516
Salt-----	180,623 tons	366,346
Stone, miscellaneous-----		1,538,017
Other minerals *-----		65,506
Total value-----		\$2,577,787

* Includes magnesium salts, potash, pyrites.

ALPINE

Land area: 776 square miles.

Population: 243 (1920 census).

Location: On eastern border of state, south of Lake Tahoe.

This county lies just south of Lake Tahoe, in the high Sierra Nevada. Transportation is by auto, wagon, or mule back, and facilities in general are lacking to promote development work.

The mineral resources of this section are varied and the country has not yet been thoroughly prospected. Occurrences of barium, copper, gold, gypsum, lead, limestone, pyrite, rose quartz, silver, tourmaline, and zine have been noted here.

Commercial production for 1927 was as follows, being an increase from \$450 in 1926:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold-----		\$146
Silver-----	105 fine oz.	60
Stone, miscellaneous-----		5,100
Total value-----		\$5,306

AMADOR

Land area: 601 square miles.

Population: 7793 (1920 census).

Location: East-central part of state—Mother Lode District.

The value of Amador County's mineral production decreased from \$2,451,500 in 1926 to \$2,207,798, placing it number sixteen on the list of counties in the state as regards total value of mineral substances marketed. The decrease was due mainly to gold.

Although having an output consisting of nine different minerals, the leading product, gold, makes up approximately 87% of the total value for the year.

Amador at one time led the state in gold production, though exceeded in 1920-1923 and in 1926-1927 by Yuba and Nevada counties, but in 1925 by Yuba County only.

Commercial output for 1927 was as follows:

Substance	Amount	Value
Clay (pottery) -----	118,636 tons	\$165,210
Gold -----	-----	1,922,714
Lead -----	2,491 lbs.	157
Silver -----	19,963 fine oz.	11,319
Stone, miscellaneous -----	-----	10,400
Other minerals * -----	-----	97,998
Total value -----	-----	\$2,207,798

* Includes brick, coal, copper, silica.

BUTTE

Land area: 1722 square miles.

Population: 30,030 (1920 census).

Location: North-central portion of state.

Butte, fortieth county in California in regard to the value of its mineral output, reported a commercial production of twelve mineral substances, having a total value of \$308,139, as compared with \$461,945 in 1926. As will be noted in the following tabulation, gold is the most important item. Butte stands tenth among the gold-producing counties of the state. Among the mineral resources of this section are asbestos, barytes, chromite, gems, gold, limestone, marble, mineral water, platinum group, silver and miscellaneous stone.

Commercial value for 1927 was as follows:

Substance	Amount	Value
Brick and clay -----	-----	\$17,800
Gems -----	-----	275
Gold -----	-----	143,494
Platinum -----	7 fine oz.	499
Silver -----	655 fine oz.	371
Stone, miscellaneous -----	-----	130,603
Other minerals * -----	-----	15,097
Total value -----	-----	\$308,139

* Includes copper, lead, mineral water, natural gas, soapstone.

CALAVERAS

Land area: 1027 square miles.

Population: 6183 (1920 census).

Location: East-central portion of state—Mother Lode district.

Calaveras County reported production of eleven different minerals, valued at \$1,608,714, during the year 1927, as compared with the 1926 output of \$1,809,772. Cement, gold, copper and stone are the chief mineral substances. In regard to total value of mineral output, Calaveras stands twenty-second among the counties of the state for 1927, and eighth in gold.

The principal mineral resources developed and undeveloped are: Asbestos, chromite, clay, copper, fuller's earth, gold, limestone, marble, mineral paint, mineral water, platinum group, pyrite, quartz crystals, silver, soapstone, and miscellaneous stone.

Commercial output for 1927 was as follows:

Substance	Amount	Value
Chromite -----	225 tons	\$5,063
Copper -----	750,909 lbs.	98,367
Gold -----	-----	219,217
Lead -----	4,606 lbs.	290
Silver -----	7,023 fine oz.	3,932
Other minerals * -----	-----	1,281,795
Total value -----	-----	\$1,608,714

* Includes cement, pottery clay, gems (quartz crystals), mineral water, soapstone, miscellaneous stone.

COLUSA

Land area: 1140 square miles.

Population: 9920 (1920 census).

Location: Sacramento Valley.

Colusa County lies largely in the basin of the Sacramento Valley. Its western border, however, rises into the foothills of the Coast Range of mountains, and its mineral resources—largely undeveloped—include coal, chromite, copper, gypsum, manganese, mineral water, pyrite, quicksilver, sandstone, miscellaneous stone, sulphur, and in some places traces of gold and silver.

The value of the 1927 production was \$13,207, a decrease from the 1926 figures of \$91,194, giving it fifty-fourth place, and was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$13,200
Unapportioned -----	7
Total value -----	\$13,207

CONTRA COSTA

Land area: 714 square miles.

Population: 53,889 (1920 census).

Location: East side of San Francisco Bay.

Contra Costa, like Alameda County, lies on the eastern shore of San Francisco Bay, and is not commonly considered among the mineral producing counties of the state. It stands seventeenth on the list in this respect, however, with an output valued at \$2,172,756 for the calendar year 1927. Various structural materials make up the chief items, including brick, cement, limestone, and miscellaneous stone. Among the others are asbestos, clay, coal, gypsum, manganese, mineral water, and soapstone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Brick and hollow building tile -----	\$303,302
Stone, miscellaneous -----	\$16,140
Other minerals * -----	1,053,314
Total value -----	\$2,172,756

* Includes cement, clay (pottery), limestone, mineral water.

DEL NORTE

Land area: 1024 square miles.

Population: 2759 (1920 census).

Location: Extreme northwest corner of state.

Transportation: Motor, wagon and mule back; steamer from Crescent City.

Del Norte almost rivals Alpine County in regard to inaccessibility. Like the latter county also, given transportation and kindred facilities, this portion of the state presents a field for development along mining lines especially. Its chief mineral resources, largely untouched, are chromite, copper, gems, gold, iron, platinum group, silver, and miscellaneous stone.

The 1927 output was a decrease from the figure of \$70,464 in 1926,

the principal item of which is crushed rock used on highway construction, and rock used on the Crescent City harbor jetty.

Commercial production for 1927, giving it fiftieth place, was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----		\$384
Silver -----	2 fine oz.	1
Stone, miscellaneous -----		53,350
Other minerals -----		240
Total value -----		\$53,975

EL DORADO

Land area: 1753 square miles.

Population: 6426 (1920 census).

Location: East-central portion of the state, northernmost of the Mother Lode counties.

El Dorado County, which contains the locality where gold in California was first heralded to the world, comes forty-fourth on the list of counties ranked according to the value of their total mineral production during the year 1927. In addition to the segregated figures here given, a large tonnage of limestone is annually shipped from El Dorado for use in cement manufacture, and whose value is included in the state total for cement. The decrease from the 1926 figure of \$302,086 was due to limestone.

The mineral resources of this section, many of them undeveloped, include asbestos, barytes, chromite, clay, copper, gems, gold, iron, molybdenum, limestone, quartz crystals, quicksilver, slate, soapstone, silver, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----		\$82,254
Limestone -----	96,733 tons	146,506
Silver -----	767 fine oz.	383
Stone, miscellaneous -----		500
Other minerals * -----		15,792
Total value -----		\$245,435

* Includes copper, gems, silica, slate, soapstone.

FRESNO

Land area: 5950 square miles.

Population: 128,779 (1920 census).

Location: South-central portion of state.

Fresno County, sixth in importance as a mineral producer among the counties of California, reported an output for 1927 of nine mineral substances with a total value of \$7,547,216, an increase from the reported 1926 production, which was worth \$6,699,928.

The bulk of the above is derived from the petroleum production of the Coalinga field, with miscellaneous stone also important.

The mineral resources of this county are many, and, aside from crude oil, are in the main not fully developed. They include asbestos, barytes, brick, chromite, copper, gems, gold, graphite, gypsum, magnesite, natural gas, petroleum, quicksilver, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick and hollow building tile	-----	\$89,145
Gold	-----	17,406
Granite	17,186 cu. ft.	74,424
Natural gas	1,682,652 M cu.ft.	148,227
Petroleum	7,202,284 bbls.	5,977,176
Silver	136 fine oz.	77
Stone, miscellaneous	-----	1,118,761
Other minerals	-----	122,000
Total value	-----	\$7,547,216

* Includes mineral water, pumice.

GLENN

Land area: 1259 square miles.

Population: 11,853 (1920 census).

Location: West side of Sacramento Valley.

Glenn County, standing forty-seventh, owes its position among the mineral-producing counties of the state mainly to the presence of large deposits of sand and gravel which are annually worked, the product being used for railroad ballast, etc. In 1917 and 1918, chromite was also an important item. In the foothills in the western portion of the county, deposits of chromite, copper, manganese, sandstone, and soapstone have been found.

Commercial production for 1927 was as follows, being an increase from the \$58,391 of the previous year:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous	\$63,869

HUMBOLDT

Land area: 3634 square miles.

Population: 37,857 (1920 census).

Location: Northwestern portion of state, bordering on Pacific Ocean.

Humboldt County is almost entirely mountainous, transportation within its limits being vary largely by auto and wagon road, and trail, and until recent years was reached from the outside world by steamer only. The county is rich in mineral resources, among which are brick, chromite, coal, clay, copper, gold, iron, mineral water, natural gas, petroleum, platinum, silver, and miscellaneous stone.

Eight mineral substances, as shown by the table given below, having a total value of \$562,802, were produced in 1927, as compared with the 1926 output of \$706,670. The main item is the large amount of rock being used in jetty construction at Humboldt Bay (Eureka Harbor).

Humboldt ranks twenty-eighth among the counties of the state for the year.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold	-----	\$1,729
Silver	25 fine oz.	14
Stone, miscellaneous	-----	554,963
Other minerals *	-----	6,096
Total value	-----	\$562,802

* Includes brick, clay (pottery), natural gas, platinum.

IMPERIAL

Land area: 4089 square miles.

Population: 43,383 (1920 census).

Location: Extreme southeast corner of the state.

During 1927 Imperial County produced nine mineral substances having a total value of \$350,977, a decrease from the 1926 output of \$467,314. Its rank is thirty-ninth. This county contains deposits of cyanite, gold, gypsum, lead, manganese, marble, pumice, salt, silver, sodium, and strontium, largely undeveloped.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$257
Silver -----	5 fine oz.	3
Stone, miscellaneous -----	-----	129,658
Other minerals * -----	-----	221,059
Total value -----	-----	\$350,977

* Includes brick, copper, cyanite, gypsum, pumice.

INYO

Land area: 10,019 square miles.

Population: 7031 (1920 census).

Location: Lies on eastern border of state, north of San Bernardino County.

Inyo, the second largest county in the state, and containing less than one inhabitant per square mile, is extremely interesting from a mineralogical point of view. It is noted because of the fact that within its borders are located both the highest point, Mount Whitney (elevation 14,502 feet), and the lowest point, Death Valley (elevation 290 feet below sea level), in the United States. In the higher mountainous sections are found many vein-forming minerals, and in the lake beds of Death Valley saline deposits exist.

Inyo's mineral production during the year 1927 reached a value of \$2,519,834, standing thirteenth among the counties of the state in this respect. Thirteen different mineral substances were produced. The 1926 production value was \$2,835,834. Its mineral resources include antimony, asbestos, barytes, borates, copper, dolomite, gems, gold, gypsum, lead, marble, soda, sulphur, talc, tungsten, and zinc.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper -----	30,010 lbs.	\$3,931
Gold -----	-----	10,109
Lead -----	2,173,032 lbs.	136,901
Pumice -----	344 tons	2,496
Silver -----	83,570 fine oz.	47,384
Soda -----	53,328 tons	1,293,379
Stone, miscellaneous -----	-----	6,000
Talc -----	7,009 tons	99,416
Other minerals * -----	-----	920,218
Total value -----	-----	\$2,519,834

* Includes borates, building stone (tuff), dolomite, gems, lime.

KERN

Land area: 8003 square miles.

Population: 54,843 (1920 census).

Location: South-central portion of state.

Kern County, because of its immensely productive oil fields, for many years stood preeminent among all counties of California in the value of

its mineral output, the exact figures for 1927 being \$64,729,488. Kern was surpassed by both Los Angeles and Orange counties in 1923, but by Los Angeles, only, in 1924-1927, for which petroleum also is responsible. The 1926 mineral output for this county was worth \$83,556,074. The decrease was due to a smaller quantity and lower prices of crude oil. During 1927 seventeen different mineral substances were produced.

Among the mineral resources, developed and undeveloped, of this section are antimony, asphalt, borax, brick, clay, cement, copper, feldspar, fuller's earth, gems, gold, gypsum, iron, lead, limestone, magnesite, marble, mineral paint, natural gas, petroleum, potash, pumice, salt, silica, silver, soapstone, soda, sulphur, and tungsten.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick -----	4,835 M	\$50,438
Gold -----	-----	171,100
Natural gas -----	39,401,478 M cu. ft.	2,057,807
Petroleum -----	51,570,412 bbls.	58,738,699
Salt -----	14,960 tons	69,839
Silver -----	15,753 fine oz.	8,932
Stone, miscellaneous -----	-----	79,510
Other minerals * -----	-----	3,553,163
Total value -----	-----	\$64,729,488

* Includes borax, cement, clay (pottery), copper, feldspar, gypsum, lime, onyx, pumice.

KINGS

Land area: 1559 square miles.

Population: 22,031 (1920 census).

Location: South-central portion of the state.

Little development has taken place in Kings County along mineral lines to date. Deposits of fuller's earth, gypsum, mineral paint, natural gas, and quicksilver, of undetermined extent, have been found in the county. Drilling for oil has been under way, and commercial output recorded for the first time in 1926.

Tulare Lake is in Kings County, though now largely drained, and the land under cultivation.

In fifty-seventh place, commercial mineral production in this county for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Unapportioned * -----	\$1,599

* Includes natural gas and petroleum.

LAKE

Land area: 1278 square miles.

Population: 5542 (1920 census).

Location: About fifty miles north of San Francisco Bay and the same distance inland from the Pacific Ocean.

On account of its topography and natural beauties, Lake County is sometimes referred to as the Switzerland of America. The mineral resources which exist here are many and varied, actual production being comparatively small, as shown by the table below, and in the past

composed mainly of quicksilver and mineral water. Some of the leading minerals found in this section, in part as yet undeveloped, are asbestos, borax, chromite, clay, copper, gems, gold, gypsum, mineral water, quicksilver, silver, and sulphur.

In forty-sixth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Mineral water -----	45,643 gals.	\$51,149
Natural gas -----	440 M cu. ft.	220
Quicksilver -----	245 flasks	29,234
Stone, miscellaneous -----	---	4,445
Total value -----		\$85,048

LASSEN

Land area: 4531 square miles.

Population: 8507 (1920 census).

Location: Northeast portion of state.

Lassen County is one of the only partly-developed sections of California. Since about 1912 a railroad traversing the county north and south has been in operation, thus affording opportunity for development along mineral and other lines.

Among the mineral resources of this county are copper, gems, gypsum, gold, silver, and sulphur. In the past, some gold had been produced, but not for some years, until 1921, when the yield again became important. In fifty-first place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	--	\$531
Granite -----	--	1,000
Silver -----	16 fine oz.	9
Stone, miscellaneous -----	--	47,885
Total value -----		\$49,425

LOS ANGELES

Land area: 4067 square miles.

Population: 936,438 (1920 census).

Location: One of the southwestern coast counties.

Mineral production in Los Angeles County for the year 1927 amounted in value to \$131,832,441, as compared with the 1926 output worth \$194,358,926. This accounts for 36% of the entire state's total for 1927, and ranks Los Angeles County first in the state as a mineral producer, having in 1923 passed Kern County, which had been leading for several years. The decrease in 1927 was due to lower petroleum prices, and a slight decrease in quantity.

Its output of brick and tile was over three million dollars, and that of petroleum amounted to over one hundred fourteen million dollars. Among the mineral resources may be noted asphalt, barytes, borax, brick, clay, fuller's earth, gems, gold, gypsum, infusorial earth, limestone, marble, mineral paint, mineral water, natural gas, petroleum, salt, glass-sand, sandstone, serpentine, silver, soapstone, and miscellaneous stone. Some potash has been obtained from kelp.

Commercial production for 1927, consisting of 20 substances, was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick -----	214,332 M	\$2,714,398
Building tile (hollow) -----	28,950 tons	288,471
Clay (pottery) -----	147,621 tons	206,175
Gold -----	-----	2,345
Lead -----	312,645 lbs.	19,697
Mineral water -----	3,934,525 gals.	260,198
Natural gas -----	59,749,559 M cu. ft.	7,117,081
Petroleum -----	103,625,615 bbl.	114,588,011
Silver -----	26,135 fine oz.	14,819
Stone, miscellaneous -----	-----	6,292,078
Other minerals * -----	-----	334,168
Total value -----	-----	\$131,832,441

* Includes copper, building stone (tuff), diatomaceous earth, iron ore, limestone, magnesite, salt, titanium, zinc.

MADERA

Land area: 2112 square miles.

Population: 12,203 (1920 census).

Location: East-central portion of state.

Madera County produced six different mineral substances during the year 1927, having a total value of \$1,059,666, as compared with the 1926 output worth \$425,738, the increase being due to granite. This county contains deposits of copper, gold, granite, iron, lead, molybdenum, pumice, silver, and miscellaneous stone.

In twenty-fourth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$4,181
Silver -----	67 fine oz.	38
Other minerals * -----	-----	1,055,447
Total value -----	-----	\$1,059,666

* Includes granite, paving blocks miscellaneous stone.

MARIN

Land area: 529 square miles.

Population: 27,342 (1920 census).

Location: Adjoins San Francisco on the north.

Mineral production in Marin County during 1927 amounted to \$527,004 compared with \$527,553 in 1926.

This county is not especially prolific in minerals, although among its resources along these lines are brick, gems, manganese, mineral water, soapstone, and miscellaneous stone.

In thirtieth place, commercial production for 1927 was:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$381,256
Other minerals * -----	145,748
Total value -----	\$527,004

* Includes brick and mineral water.

MARIPOSA

Land area: 1453 square miles.

Population: 2775 (1920 census).

Location: Most southerly of the Mother Lode counties. East-central portion of state.

Mariposa County is one of the distinctly 'mining' counties of the state, although it stands but thirty-first on the list of counties in regard to the value of its mineral output for 1927, with a total of \$499,878, as compared with the 1926 figure of \$319,724, the increase being due mainly to stone and barytes.

Its mineral resources are varied; among the more important items being barytes, copper, gems, gold, lead, marble, silver, slate, soapstone, and miscellaneous stone.

The Yosemite Valley is in Mariposa County.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	----	\$183,805
Granite -----	----	2,000
Silver -----	2,427 fine oz.	1,376
Stone, miscellaneous -----	----	259,677
Other minerals * -----	----	53,020
Total value -----		\$499,878

* Includes barytes, pyrites, slate.

MENDOCINO

Land area: 3453 square miles.

Population: 24,116 (1920 census).

Location: Joins Humboldt County on the south and bounded by the Pacific Ocean on the west.

Mendocino's annual mineral production has usually been small, the 1927 output being valued at \$47,670, ranking it fifty-second among the counties. That of 1926 was worth \$15,800, the increase being due mainly to miscellaneous stone.

Deposits of in part undetermined value of asbestos, chromite, coal, copper, graphite, magnesite, and mineral water have been found, as well as traces of gold, platinum, and silver.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$44,630
Other minerals * -----	3,040
Total value -----	\$47,670

* Includes brick and natural gas.

MERCED

Land area: 1995 square miles.

Population: 24,579 (1920 census).

Location: About the geographical center of the state.

Merced County as a whole lies in the San Joaquin Valley and it figures as one of the lesser mineral producing counties of the state.

The 1927 mineral output was valued at \$366,873, compared with \$192,665 in 1926, the increase being due to cement.

Gold, platinum, and silver were formerly obtained in important amounts by dredging, which ceased in this county in 1918, though a small yield from other sources is still occasionally had. Undeveloped deposits of antimony, magnesite, quicksilver, and limestone have been noted in this county in addition to the foregoing.

In thirty-sixth place, the commercial production during 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$189,537
Other minerals * -----	177,336
Total value -----	\$366,873

* Includes brick and hollow building tile, cement, clay (pottery).

MODOC

Land area: 3823 square miles.

Population: 5425 (1920 census).

Location: The extreme northeast corner of the state.

Modoc County, like Lassen, has only in recent years had the benefit of communication with the outside world by rail. Among its known mineral resources are clay, coal, gold, iron, quicksilver, salt, and silver.

In forty-ninth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$61,651
Other minerals -----	600
Total value -----	\$62,251

MONO

Land area: 3030 square miles.

Population: 960 (1920 census).

Location: Is bordered by the state of Nevada on the east and is about in the central portion of the state measured on a north and south line.

Gold mining has been carried on in portions of Mono County for many years, although, taken as a whole, it lies in a somewhat inaccessible country so far as rail transportation is concerned. It is in the continuation of the highly mineralized belt which was noted in Inyo County and contains among other mineral resources barytes, clay, copper, gold, limestone, molybdenum, pumice, salt, silver, and travertine.

In forty-fifth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----		\$3,686
Lead -----	4,830 lbs.	304
Silver -----	38,487 fine oz.	21,822
Other minerals * -----		76,375
Total value -----		\$102,187

* Includes clay (pottery), copper, pumice, salt, sillimanite-andalusite, miscellaneous stone.

MONTEREY

Land area: 3330 square miles.

Population: 27,980 (1920 census).

Location: West-central portion of state, bordering on Pacific Ocean.

Monterey County produced twelve mineral substances during the year 1927, having a total value of \$351,049, as compared with the 1926 output, worth \$359,049. Its mineral resources include brick, clay, copper, coal, diatomaceous earth, dolomite, feldspar, fuller's earth, gold, gypsum, limestone, mineral water, petroleum, quicksilver, glass-sand, sandstone, silver, and miscellaneous stone.

In thirty-eighth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery) -----	1,100 tons	\$550
Gold -----	---	500
Silver -----	4 fine oz.	2
Stone, miscellaneous -----	---	244,584
Other minerals * -----	---	105,413
Total value -----		\$351,049

* Includes diatomaceous earth, dolomite, salt, 'sandstone' (shale building stone).

NAPA

Land area: 783 square miles.

Population: 20,678 (1920 census).

Location: Directly north of San Francisco Bay—one of the 'bay counties.'

Napa, because of its production of structural and industrial materials and mineral water, stands thirty-fourth on the list of mineral-producing counties in California. Its mineral resources include chromite, copper, magnesite, mineral water, quicksilver, sandstone, and miscellaneous stone. In the past this county has been one of the important producers of quicksilver.

In 1927 the value of the output increased to \$417,229 from the 1926 figure of \$341,571, the increase being due to quicksilver.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	---	\$7,235
Mineral water -----	81,864 gals.	50,116
Quicksilver -----	776 flasks	88,425
Silver -----	99,532 fine oz.	56,435
Stone, miscellaneous -----	---	209,996
Other minerals * -----	---	5,022
Total value -----		\$417,229

* Includes copper and sandstone.

NEVADA

Land area: 974 square miles.

Population: 10,860 (1920 census).

Location: North of Lake Tahoe, on the eastern border of the state.

Nevada, one of the mountain counties of California, for some years alternated with Amador in the gold lead, but both were passed by Yuba

in 1918-1921, also 1923. In 1922 and 1924, Nevada led, but dropped to third place in 1925, regaining second in 1926. Nevada County stands fifteenth on the list in regard to value of its total mineral output for 1927 with a figure of \$2,213,709 as compared with the 1926 production worth \$3,240,211. The decrease is due mainly to miscellaneous stone, but in part to gold.

While this county actually produces mainly gold and silver, its resources cover a wide scope, including antimony, asbestos, barytes, chromite, clay, copper, gems, iron, lead, mineral paint, pyrites, soapstone, and tungsten.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$2,127,195
Silver -----	48,644 fine oz.	27,581
Stone, miscellaneous -----	-----	15,000
Other minerals * -----	-----	43,933
Total value -----		\$2,213,709

* Includes barytes, copper, granite, lead.

ORANGE

Land area: 795 square miles.

Population: 61,375 (1920 census).

Location: Southwestern portion of state, bordering Pacific Ocean.

Orange County is one of the many in California which on casual inspection appears to be anything but a mineral producing section. It stood for several years, however, as the second county in the state in regard to the total value of mineral output, on account of its highly productive oil fields. It was passed in 1922 by Los Angeles, the credit for which is also due to oil, and in turn Orange passed Kern County in 1923, but dropped back to third in 1924-1926.

This county shows a mineral production for 1927 of \$60,547,041, compared to the 1926 output, worth \$63,223,082, the decrease due to lower petroleum prices. Orange passed Shasta County in 1917, which previously for a number of years had exceeded all other counties in California, except Kern.

Aside from the substances actually produced and noted in the table below, coal, gypsum, iron, infusorial earth, sandstone, and tourmaline have been found in Orange County.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick -----	1,283 M	\$13,143
Clay (pottery) -----	14,637 tons	49,354
Natural gas -----	50,981,982 M cu. ft.	3,910,501
Petroleum -----	46,593,842 bbl.	56,238,767
Stone, miscellaneous -----	-----	325,676
Other minerals * -----	-----	9,600
Total value -----		\$60,547,041

* Includes barytes and quicksilver.

PLACER

Land area: 1395 square miles.

Population: 18,584 (1920 census).

Location: Eastern border of state directly west of Lake Tahoe.

While standing only thirty-seventh on the list of mineral producing counties, Placer contains a wide variety of mineral substances, some of

which have not been commercially exploited. Its leading products include gold, chromite, granite, copper, and clay. Other mineral resources are asbestos, brick, coal, gems, iron, lead, limestone, magnesite, manganese, marble, quartz crystals, glass-sand, silver, and miscellaneous stone.

Commercial production for 1927 was as follows, compared to a total value of \$480,882 for the preceding year:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Clay (pottery) -----	61,388 tons	\$106,710
Gold -----		97,494
Granite -----	8,590 cu. ft.	18,109
Silica -----	2,700 tons	8,100
Silver -----	776 oz.	440
Stone, miscellaneous -----		40,357
Other minerals -----		89,014
Total value -----		\$360,224

PLUMAS

Land area: 2594 square miles.

Population: 5681 (1920 census).

Location: Northeastern border of state, south of Lassen County.

A considerable portion of the area of Plumas County lies in the high mountains, and deposits of the metals, especially gold and copper, are found there. Mineral production for 1927 was valued at \$3,260,723, the decrease being due to copper and silver. This placed the county tenth in rank. In 1919 Plumas passed Shasta in the copper lead, owing to the Shasta smelters being closed down, which position Plumas still retains.

Among its mineral resources are chromite, copper, gold, granite, iron, lead, limestone, manganese, molybdenum, platinum, silver, and zinc.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper -----	21,055,425 lbs.	\$2,758,261
Gold -----		321,016
Silver -----	315,887 fine oz.	179,108
Other minerals * -----		2,338
Total value -----		\$3,260,723

* Includes granite, lead, lime.

RIVERSIDE

Land area: 7240 square miles.

Population: 60,297 (1920 census).

Location: Southern portion of state.

Riverside is the fourth county in the state in size and the seventh in regard to the total value of mineral output for 1927. Within its borders are included mountain, desert, and agricultural land. Its mineral resources include metals, structural and industrial materials, and salines, some of the more important being brick, clay, coal, copper, feldspar, gold, gypsum, iron, lead, limestone, manganese, magnesite, marble, mineral paint, mineral water, salt, soapstone, silver, miscellaneous stone, and tin. In point of variety, Riverside County showed seventeen different minerals commercially produced in 1927. The increase in 1927 from the 1926 value of \$6,194,253 was due to cement, brick, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick and hollow building tile-----	-----	\$696,795
Clay (pottery) -----	118,510 tons	198,330
Copper -----	19,201 lbs.	2,515
Gold -----	-----	1,492
Lead -----	121,667 lbs.	7,665
Silica (quartz) -----	14,262 tons	60,991
Silver -----	3,385 fine oz.	1,919
Stone, miscellaneous -----	-----	1,244,034
Other minerals * -----	-----	4,329,619
Total value -----		\$6,543,369

* Includes cement, feldspar, granite, gypsum, limestone, mineral water, onyx, zinc.

SACRAMENTO

Land area: 983 square miles.

Population: 90,978 (1920 census).

Location: North-central portion of state.

Sacramento stands fourteenth among the counties of the state as a mineral producer, the output, principally gold, for 1927 being valued at \$2,348,916, as compared with the 1926 production worth \$2,243,952.

In regard to gold output alone, this county ranks fourth, being exceeded only by Yuba, Nevada and Amador counties, the Sacramento product coming from the dredges. Its mineral resources include brick, clay, gold, granite, natural gas, platinum, silver, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick and hollow building tile-----	-----	\$295,677
Gold -----	-----	1,211,278
Granite -----	-----	33,600
Silver -----	2,596 fine oz.	1,472
Stone, miscellaneous -----	-----	754,206
Other minerals * -----	-----	52,683
Total value -----		\$2,348,916

* Includes clay, natural gas, platinum.

SAN BENITO

Land area: 1392 square miles.

Population: 8995 (1920 census).

Location: West-central portion of state.

While nineteenth among the counties of the state in regard to value of total mineral production for 1927, San Benito has led for some years in one important branch of the mineral industry, namely, quicksilver. Cement is also an important item.

Its other mineral resources, many of them undeveloped, include antimony, asbestos, bituminous rock, chromite, coal, dolomite, gems, gypsum, limestone, magnesite, mineral water, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Quicksilver -----	4,380 flasks	\$485,409
Stone, miscellaneous -----	-----	371,050
Other minerals * -----	-----	1,045,395
Total value -----		\$1,901,854

* Includes antimony, asbestos, cement, mineral water, pyrite.

SAN BERNARDINO

Land area: 20,157 square miles.

Population: 73,401 (1920 census).

Location: Southeastern portion of state.

San Bernardino, by far the largest county in the state in area, ranks fifth as regards the value of its mineral output for 1927 with a total of \$16,140,703, as compared with the 1926 total of \$14,218,475. The increase is due mainly to cement, in spite of decreases in gold and silver.

San Bernardino for several years (except 1918) has led all other counties in the state in point of variety of minerals, producing commercially during 1927 a total of 23 different substances. This county also ranks first as a silver producer in the state, from the mines of the Randsburg district.

This county, consisting largely of mountain and desert country, is highly mineralized, the following being included among its resources: Asbestos, barytes, borax, brick, cement, clay, copper, gems, gold, granite, gypsum, iron, lead, limestone, manganese, marble, mineral paint, mineral water, nitre, potash, salt, soapstone, soda, miscellaneous stone, strontium, tale, tungsten, vanadium, and zinc.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Cement -----	5,557,339 bbls.	\$9,823,839
Copper -----	197,135 lbs.	25,824
Fullers earth (filtering clay) -----	1,798 tons	26,603
Gold -----	---	82,225
Lead -----	125,692 lbs.	7,919
Lime -----	12,170 tons	92,363
Limestone -----	550,011 tons	348,384
Silver -----	788,580 fine oz.	447,125
Soapstone -----	6,544 tons	49,400
Stone, miscellaneous -----	---	311,470
Other minerals * -----	---	4,925,551
Total value -----		\$16,140,703

* Includes borates, calcium chloride, clay (pottery), gems, mineral water, onyx, petroleum, potash, salt, silica, tungsten concentrates, soda.

SAN DIEGO

Land area: 4221 square miles.

Population: 112,248 (1920 census).

Location: Extreme southwest corner of state.

San Diego ranks twenty-first in the total value of its mineral output for the year, with 19 different commercial minerals. The value for 1927 equaled \$1,619,431, as compared with the 1926 output worth \$1,241,324.

In the production of gems, San Diego County has led the state. Aside from minerals commercially produced, as shown below, San Diego County contains occurrences of bismuth, lithia, marble, nickel, soapstone, and tin. Potash has been produced from kelp.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick and hollow building tile-----		\$165,170
Clay-----	16,190 tons	31,765
Fullers earth (filtering clay)-----	7,396 tons	69,661
Gems-----		3,500
Gold-----		11,490
Granite-----	18,858 cu. ft.	63,142
Mineral water-----	109,685 gals.	51,559
Silver-----	162 fine oz.	92
Stone, miscellaneous-----		889,642
Other minerals *-----		333,410
Total value -----		\$1,619,431

* Includes bromine, feldspar, heptane, lithia, magnesium chloride, paving blocks, salt.

SAN FRANCISCO

Land area: 46½ square miles.

Population: 506,676 (1920 census).

Surprising as it may appear at first glance, San Francisco County is listed among the mineral producing sections of the state, actual production consisting mainly of crushed rock, sand and gravel. Small quantities of various valuable mineral substances are found here, including cinnabar, gypsum, lignite, and magnesite, none, however, in paying quantities. Some pumice has been produced.

In forty-eighth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$62,700

SAN JOAQUIN

Land area: 1448 square miles.

Population: 79,905 (1920 census).

Location: Central portion of state.

San Joaquin County reported a mineral production for the year 1927 having a total value of \$711,965, as compared with the 1926 output worth \$842,000.

Comparatively few mineral substances are found here, the chief ones being brick, clay, manganese, natural gas, glass-sand, and miscellaneous stone. Gold, platinum and silver have been obtained by dredging in the Mokelumne River, which forms the boundary between this county and Amador on the northeast.

In twenty-seventh place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Brick and hollow building tile-----	\$630,218
Stone, miscellaneous -----	81,747
Total value -----	\$711,965

SAN LUIS OBISPO

Land area: 3334 square miles.

Population: 21,893 (1920 census).

Location: Bordered by Kern County on the east and the Pacific Ocean on the west.

The total value of the mineral production of San Luis Obispo County in 1927 was \$295,030, as compared with the 1926 output worth \$253,294, the increase being due to quicksilver.

Among its mineral resources, both developed and undeveloped, are asphalt, bituminous rock, brick, chromite, coal, copper, diatomaceous earth, gypsum, iron, limestone, marble, mineral water, onyx, petroleum, quicksilver, soda and miscellaneous stone.

In forty-second place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Petroleum -----	16,709 bbls.	\$12,531
Quicksilver -----	470 flasks	53,600
Stone, miscellaneous -----		195,831
Other minerals * -----		33,268
Total value -----		\$295,030

* Includes brick and hollow building tile, copper, mineral water, volcanic ash.

SAN MATEO

Land area: 447 square miles.

Population: 36,781 (1920 census).

Location: Peninsula, adjoined by San Francisco on the north.

San Mateo's most important mineral products are cement, stone and salt, the last-named being derived by evaporation from the waters of San Francisco Bay. The total value of all mineral production during 1927 equaled \$1,863,838, as compared with the 1926 figures of \$1,893,853.

Small amounts of barytes, chromite, infusorial earth, and quicksilver have been noted in addition to the items of economic value given below. Bricks have also been produced commercially.

In twentieth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$129,802
Other minerals * -----	1,734,036
Total value -----	\$1,863,838

* Includes cement, limestone, natural gas, petroleum, salt.

SANTA BARBARA

Land area: 2740 square miles.

Population: 41,097 (1920 census).

Location: Southwestern portion of state, adjoining San Luis Obispo on the south.

Santa Barbara County owes its position of eleventh in the state in regard to its mineral output to the presence of productive oil fields within its boundaries. The total value of its mineral production during the year 1927 was \$2,699,296, as compared with the 1926 output of \$2,583,548, and included eleven different mineral substances. The increase was due to petroleum and diatomaceous earth.

Aside from the mineral substances listed below, Santa Barbara County contains asphalt, gilsonite, gypsum, magnesite, and quicksilver in more or less abundance.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Natural gas -----	1,701,715 M cu. ft.	\$204,775
Petroleum -----	2,173,887 bbls.	1,630,415
Stone, miscellaneous -----		139,093
Other minerals * -----		725,013
Total value -----		\$2,699,296

* Includes bituminous rock, brick and hollow building tile, clay, diatomaceous earth, mineral water, sandstone, shale oil.

SANTA CLARA

Land area: 1328 square miles.

Population: 100,588 (1920 census).

Location: West-central portion of state.

Santa Clara County reported a mineral output for 1927 of \$990,876 as compared with the 1926 figures of \$1,028,506.

This county, lying largely in the Coast Range Mountains, contains a wide variety of mineral substances, including brick, chromite, clay, limestone, magnesite, manganese, mineral water, petroleum, quicksilver, soapstone, and miscellaneous stone.

In twenty-fifth place, commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick -----	20,254 M	\$199,472
Clay (pottery) -----	4,373 tons	4,261
Petroleum -----	11,994 bbls.	14,212
Stone, miscellaneous -----	-----	457,703
Other minerals * -----	-----	315,228
Total value -----	-----	\$990,876

* Includes magnesite and mineral water.

SANTA CRUZ

Land area: 435 square miles.

Population: 26,269 (1920 census).

Location: Bordering Pacific Ocean, just south of San Mateo County.

The mineral output of Santa Cruz County, a portion of which is itemized below, amounted to a total value of \$3,473,209, giving the county a standing of ninth among all others in the state in this regard. This is a slight decrease from the 1926 figure of \$3,504,194.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Lime -----	13,431 tons	\$173,207
Limestone -----	16,717 tons	38,045
Stone, miscellaneous -----	-----	45,570
Other minerals * -----	-----	3,216,387
Total value -----	-----	\$3,473,209

* Includes bituminous rock and cement.

SHASTA

Land area: 3858 square miles.

Population: 13,311 (1920 census).

Location: North-central portion of state.

Shasta County stood eighteenth in California among the mineral producing counties for 1927, with an output valued at \$1,950,088, as compared with the 1926 production worth \$2,886,144, the decrease being due to zinc, and in part to gold.

The marked decrease since 1918 is due to the falling off in the output of copper, the large plants of the Mammoth and Mountain copper companies being shut down. Not taking petroleum into account, Shasta for a number of years led all of the counties by a wide margin, but in 1919-1923 was passed by San Bernardino, Plumas, Yuba, Inyo, Sacramento, Nevada, and Amador, among the 'metal' counties, though by only San Bernardino and Plumas of that group in 1925.

Shasta's mineral resources include asbestos, barytes, brick, chromite, coal, copper, gold, iron, lead, lime, limestone, mineral water, molybdenum, pyrites, silver, soapstone, miscellaneous stone, and zinc.

Lassen Peak is located in southeastern Shasta County.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper -----	4,524,906 lbs.	\$592,763
Gold -----	-----	191,900
Lead -----	1,780 lbs.	112
Platinum -----	25 fine oz.	2,552
Silver -----	123,967 fine oz.	70,261
Stone, miscellaneous -----	-----	134,678
Other minerals * -----	-----	957,822
Total value -----	-----	\$1,950,088

* Includes diatomaceous earth, limestone, pyrite, talc, zinc.

SIERRA

Land area: 923 square miles.

Population: 1783 (1920 census).

Location: Eastern border of state just north of Nevada County.

Sierra County reported a mineral production of \$752,533, mainly of gold and silver, during the year 1927, as compared with the 1926 output worth \$569,515, the increase being due to gold. Considering gold output this county stands sixth; and as to total mineral yield twenty-sixth.

Aside from the metals itemized below, Sierra County contains deposits of asbestos, chromite, copper, iron, lead, platinum, serpentine, and talc.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$678,873
Silver -----	5,909 fine oz.	3,350
Stone, miscellaneous -----	-----	70,300
Other minerals -----	-----	10
Total value -----	-----	\$752,533

SISKIYOU

Land area: 6256 square miles.

Population: 18,545 (1920 census).

Location: Extreme north-central portion of state, next to Oregon boundary.

Siskiyou, fifth county in California in regard to size, located in a highly mineralized and mountainous country, ranks forty-first in regard to the value of its mineral output for 1927.

Although this county is traversed by a transcontinental railroad in a north and south line, the mineral-bearing sections are almost without exception far from transportation and other facilities. A large part of the country is accessible by trail only. Future development and exploitation will increase the productiveness of this part of the state to a considerable degree.

Mount Shasta is located in Siskiyou County.

Among Siskiyou's mineral resources are chromite, clay, coal, copper, gems, gold, lead, limestone, manganese, marble, mineral water, pumice, quicksilver, sandstone, silver, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$138,822
Platinum -----	9 fine oz.	690
Silver -----	1,033 fine oz.	586
Stone, miscellaneous -----	-----	102,428
Other minerals * -----	-----	66,420
Total value -----		\$298,946

* Includes mineral water and sandstone.

SOLANO

Land area: 822 square miles.

Population: 40,602 (1920 census).

Location: Touching San Francisco Bay on the northeast.

Solano, while mostly valley land, produced mineral substances during the year 1927 to the total value of \$1,557,840, ranking twenty-third among the counties of the state, the decrease from the 1926 figures of \$1,770,820 being due to cement.

Among her mineral resources are brick, cement, clay, fuller's earth, limestone, mineral water, natural gas, onyx, quicksilver, salt and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Unapportioned * -----	\$1,557,840

* Includes cement, clay (pottery), mineral water, onyx, travertine, miscellaneous stone.

SONOMA

Land area: 1577 square miles.

Population: 51,990 (1920 census).

Location: South of Mendocino County, bordering on the Pacific Ocean.

Sonoma ranked forty-third among the counties of California during the year 1927, with a mineral production of \$265,392, as compared with its 1926 output of \$222,586. More paving blocks have been turned out here than in any other section of the state, but this industry has now ceased, owing to the construction of smooth-surface pavements both in the cities and on the highways.

Among Sonoma's mineral resources are brick, chromite, clay, copper, graphite, infusorial earth, magnesite, manganese, marble, mineral paint, mineral water, quicksilver, and miscellaneous stone.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Mineral water -----	25,428 gals.	\$5,889
Quicksilver -----	373 flasks	43,068
Stone, miscellaneous -----	---	208,753
Other minerals * -----	---	7,682
Total value -----		\$265,392

* Includes petroleum and sandstone.

STANISLAUS

Land area: 1450 square miles.

Population: 43,557 (1920 census).

Location: Center of state, bounded on south by Merced County.

Gold has usually been the chief mineral product of Stanislaus County, but it was exceeded in 1918-1919 by manganese, and in 1921-1923 and 1925-1927 by miscellaneous stone. Brick, clay, gypsum, mineral paint, quicksilver, and silver are found here to some extent as well. This county for 1927 ranks thirty-fifth in the state in regard to value of minerals, with an output of \$393,089, as compared with \$401,997 in 1926, the decrease being due mainly to gold. Gold, platinum, and silver are obtained mainly by dredging.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	---	\$120,238
Silver -----	608 fine oz.	345
Stone, miscellaneous -----	---	259,806
Other minerals * -----	---	12,700
Total value -----		\$393,089

* Includes magnesite, mineral paint, platinum.

SUTTER

Land area: 608 square miles.

Population: 10,115 (1920 census).

Location: Bounded by Butte County on the north and Sacramento on the south.

Sutter is one of only two counties in the state which for a number of years reported no commercial output of some kind of mineral substance. In 1917 some crushed rock was taken out, from the Marysville Buttes, also in 1925-1926. There has been some utilization of natural gas. The 1927 mineral yield was valued at \$300, being concealed under 'unapportioned.' Both clay and coal exist here, but deposits of neither mineral have been placed on a productive basis.

TEHAMA

Land area: 2893 square miles.

Population: 12,882 (1920 census).

Location: North-central portion of the state, bounded on the north by Shasta.

Tehama stands fifty-fifth among the mineral producing counties of the state for 1927, when its output was valued at \$5,350, as compared with the 1926 yield worth \$10,340, the decrease being due to brick and chromite.

Among its mineral resources are listed brick, chromite, copper, gold, manganese, marble, mineral water, salt, and miscellaneous stone.

The 1927 yield was distributed as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$4,450
Other minerals -----	900
Total value -----	\$5,350

TRINITY

Land area: 3166 square miles.

Population: 2551 (1920 census).

Location: Northwestern portion of state.

Trinity, like its neighbor, Siskiyou County, requires transportation facilities to further the development of its many and varied mineral resources. Deposits of asbestos, barytes, chromite, copper, gold, mineral water, platinum, quicksilver, silver, and building stone are known here, but with the exception of gold, chromite, copper, quicksilver and platinum, very little active production of these mineral substances has been made as yet. The 1927 output of \$555,854 shows a decrease from the 1926 figure of \$611,797 due to gold, giving the county rank of twenty-ninth for the year.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Copper -----	770,882 lbs.	\$100,986
Gold -----	-----	409,432
Silver -----	21,739 fine oz.	12,326
Stone, miscellaneous -----	-----	32,250
Other minerals -----	-----	800
Total value -----	-----	\$555,854

TULARE

Land area: 4856 square miles.

Population: 59,031 (1920 census).

Location: Bounded by Inyo on the east, Kern on the south, Fresno on the north.

Tulare stands thirty-second on the list of mineral producing counties, the decrease from the 1926 value being due mainly to magnesite.

This county's mineral resources, among others, are brick, clay, copper, feldspar, graphite, gems, limestone, magnesite, marble, quartz, glass-sand, soapstone, miscellaneous stone, and zine. Tulare for a number of years led the state in magnesite output, except in 1918 when it was passed by Napa County, and since 1921 by Santa Clara.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Value</i>
Stone, miscellaneous -----	\$15,082
Other minerals * -----	459,091
Total value -----	\$474,173

* Includes brick, building tile, granite, lime, limestone, magnesite.

TUOLUMNE

Land area: 2190 square miles.

Population: 7768 (1920 census).

Location: East-central portion of state—Mother Lode District.

Tuolumne ranks thirty-third among counties of the state relative to its total value of mineral output for 1927. This county ranks first as a producer of marble in the state. The decrease in the year's valuation to \$432,416 for 1927 from the 1926 figure of \$615,998 was due mainly to gold.

Chromite, clay, copper, gold, lead, limestone, marble, mineral paint, platinum, soapstone, silver, and miscellaneous stone are among its mineral resources.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$40,209
Silver -----	533 fine oz.	302
Stone, miscellaneous -----	-----	31,416
Other minerals * -----	-----	360,489
Total value -----	-----	\$432,416

* Includes limestone, marble, slate.

VENTURA

Land area: 1878 square miles.

Population: 28,724 (1920 census).

Location: Southwestern portion of state, bordering on Pacific Ocean.

Ventura is the fourth county in the state in respect to the value of its mineral production for 1927, the exact figure being \$30,995,379, as compared with the output for 1926 worth \$30,208,369, the increase being due to natural gas and miscellaneous stone notwithstanding a cut in petroleum prices.

Commercial production for 1927 was as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Brick and hollow building tile -----	-----	\$31,832
Clay (pottery and oil-well mudding) -----	354,418 tons	63,120
Natural gas -----	71,036,201 M cu. ft.	6,951,273
Petroleum -----	19,996,841 bbls.	23,536,282
Stone, miscellaneous -----	-----	412,872
Total value -----	-----	\$30,995,379

YOLO

Land area: 1017 square miles.

Population: 17,105 (1920 census).

Location: Sacramento Valley, bounded by Sutter on the east and Colusa on the north.

The mineral production from Yolo County during the year 1927 consisted entirely of miscellaneous stone, valued at \$17,895, ranking it in fifty-third place. Deposits of undetermined value of iron and sandstone have been discovered within the confines of this county. Quick-silver has also been produced.

YUBA

Land area: 639 square miles.

Population: 10,375 (1920 census).

Location: Lies west of Sierra and Nevada counties; south of Plumas.

Yuba is eighth of the mineral producing counties of the state, and first in regard to gold output for 1925-1927, having passed Nevada and Amador counties in that metal. Iron and clay deposits have been reported in this county aside from the following commercial production shown for the year 1927. The increase over the 1926 figure of \$2,921,083 was due mainly to gold obtained by the dredgers, which also yield silver and platinum. The 1921 dredge yield of gold was a record for the county.

The 1927 production of Yuba County was distributed as follows:

<i>Substance</i>	<i>Amount</i>	<i>Value</i>
Gold -----	-----	\$3,468,201
Silver -----	11,893 fine oz.	6,743
Stone, miscellaneous -----	-----	198,688
Other minerals -----	-----	6,000
Total value -----	-----	\$3,679,632

CHAPTER EIGHT

TOTAL RECORDED MINERAL PRODUCTION BY COUNTIES

Herein in the tabulations following we present the total mineral yield of each county of the state from the earliest available records to and including 1927. These tables were previously printed in *MINING IN CALIFORNIA*, November, 1922, Chapter of Report XVIII of the State Mineralogist, which included the data to the end of 1921.

In a number of cases it is known that there were productions of specific minerals in the years previous to the earliest years shown in these tabulations; but unfortunately, there are few detailed or accurate records showing county segregations prior to 1894 when compilation of the statistical records of the California State Mining Bureau began. For gold and silver, the published reports of the U. S. Geological Survey and the Director of the Mint give county segregations back to 1880; but, prior to that year, we have only the state total annually. In the case of quicksilver, there are authentic records for all of the important mines, from which we have compiled county tables for the early years.

The "unapportioned" column is necessitated by the fact that in many cases there is but a single operator or mine producing a given mineral in the county. As it is the policy of the Division of Mines and Mining not to reveal the individual's private business without his consent, we combine the values of such products.

Year	Brick		Chromite		Pottery clay		Coal		Manganese	
	M	Value	Tons	Value	Tons	Value	Tons	Value	Tons	Value

*Estimated.

*Coal mining began in the Mount Diablo section of Contra Costa County at least as early as 1861, but there are no segregated county figures available earlier than those here shown. For 1867-1882 (inc.), there are records which indicate for the Mount Diablo field a total of approximately 2,500,000 tons, valued at \$14,300,000.

COUNTY, 1894-1927.

1 See under 'Unapportioned.'

2 Includes antimony, borax, gypsum, marble, molybdenum, salt, tungsten.

3 Includes asbestos, barytes, borax, gypsum, marble, molybdenum.

4 Includes borax, dolomite, marble, pumice, salt, soda, talc, tungsten.

5 Includes borax, dolomite, fuller's earth, marble, volcanic ash, salt, talc, zinc.

6 Includes borax, building stone, marble, pumice, soda.

7 Includes borax, building stone, clay (pottery), fuller's earth, limestone, marble, pumice, soda, talc, zinc.

8 Includes building stone, borates, fuller's earth, gems, marble, pumice, tungsten concentrates.

¹ Madera County created March 11, 1893, from a portion of Fresno County. Between 80 per cent and 90 per cent of the gold¹ and silver produced in Fresno County prior to 1893 was from that part now in Madera County.

² Includes crushed rock, rubble, rip-rap, sand, gravel.

³ See under 'Unapportioned.'

COUNTY, 1893-1927.

†Figures for value of clay are for crude clay only. The annual value of clay products is several times greater, but is omitted because there is only one factory. Production began in 1875.

1 Includes granite (prior to 1916), crushed rock, rubble, rip-rap, paving blocks, sand, gravel.

2 Barrels of lime.

3 Tons of limestone.

4 See under 'Unapportioned.'

¹Production of manganese ore in California began at the Ladd Mine, San Joaquin County, in the Tesla District in 1867. When shipments of this ore to England ceased late in 1874, upwards of 5,000 tons had been produced by that property. Annual amounts earlier than 1894 not separable.

²Estimated.

³See under 'Unapportioned'.

⁴Includes crushed rock, rubble, rip-rap, sand, gravel.

*Copper was weighed in tons of 2,360 pounds and chromite in tons of 2,240 pounds, but here converted to 2,000 pounds.

¹The total production of asphaltum up to 1894 was reported as 800 barrels. This production reduced to tons is shown under 1894.

²Although a great deal of chromic iron ore was mined and marketed during the '70's, there are no records of yearly production. The above figure for 1880 represents the total shipments from San Luis Obispo up to August, 1880.

[illegible]

Concentrates.

¹Includes crushed rock, rubble, sand, gravel; also granite and sandstone prior to 1915

*See under 'Unapportioned'.

¹The limestone produced in San Mateo County is used as crushed rock and is included under Stone Industry. Previous to 1915 it was erroneously classified as industrial limestone and tabulated under that heading.

²Includes crushed rock, rubble, sand, gravel.

³See under 'Unapportioned.'

COUNTY, 1895-1927.

¹Includes crushed rock, sand, gravel.²Recalculated to 'commercial' from 'coining value' as originally published.³See under 'Unapportioned.'⁴Includes some palladium.

APPENDIX A.

DIRECTORY OF PRODUCERS OF METALLIC AND NON-METALLIC MINERALS IN CALIFORNIA, 1927

NOTE.—The producers of natural gas and petroleum will be found in Summary of Operations, California Oil Fields, for August, 1927 (Vol. 13, No. 2). This list also excludes producers of copper, gold, lead, platinum, silver and zinc. Gold and silver figures are received by the State Division of Mines and Mining direct from the U. S. Bureau of Mines, and copper, lead, platinum and zinc statistics are gathered in part from reports received from smelters.

APPENDIX A.

DIRECTORY OF PRODUCERS OF METALLIC AND NON-METALLIC MINERALS IN CALIFORNIA, 1927

ANTIMONY

	Address	Mine or Plant
<i>San Benito County</i> Stayton Quicksilver Mines, R. E. Knox-----	Hollister-----	Hollister

BARITE

	Address	Mine
<i>Mariposa County</i> Yosemite Barium Co., R. A. Fredericks, Pres. and Mgr. -----	El Portal-----	El Portal
<i>Nevada County</i> Democrat Barite Mine, Chemical and Pigment Co. -----	766 50th Ave., Oakland-----	Bear River
<i>Orange County</i> Red Hill Quicksilver Mine, F. B. Browning----	Tustin-----	Tustin

BITUMINOUS ROCK

	Address	Quarry
<i>Santa Barbara County</i> Higgins Quarry, A. Satler, lessee-----	Carpinteria-----	Carpinteria
<i>Santa Cruz County</i> Bitumen Mines Operation, John De Bruynkops---	701 Post St., San Francisco-----	Santa Cruz

BORATES

	Address	Plant
<i>Inyo County</i> Rasor Borate Lease, C. M. Rasor--	Care of Pac. Coast Borax Co., 1014 Cent. Bldg., Los Angeles--	Death Valley
Pacific Coast Borax Co.-----	1014 Central Bldg., Los Angeles--	-----
<i>Kern County</i> Pacific Coast Borax Co.-----	1014 Central Bldg., Los Angeles--	Kramer
<i>San Bernardino County</i> Amer. Potash and Chemical Corp.--	Trona -----	Trona

BROMINE

	Address	Plant
<i>San Diego County</i> California Chemical Corp.-----	233 Sansome St., San Francisco--	-----

CALCIUM CHLORIDE

	Address	Plant
<i>San Bernardino County</i>		
California Rock Salt Co.	2465 Hunter St., Los Angeles....	Amboy
Saline Products, Inc.	2600 Santa Fe Ave., Los Angeles..	-----

CEMENT

	Address	Plant
<i>Calaveras County</i>		
Calaveras Cement Co.	315 Montgomery St., San Francisco	San Andreas
<i>Contra Costa County</i>		
Henry Cowell Lime and Cement Co. .	2 Market St., San Francisco..	Cowell
<i>Kern County</i>		
Monolith Portland Cement Co.	Bartlett Bldg., Los Angeles..	Monolith
<i>Merced County</i>		
Yosemite Portland Cement Co.	Merced	Merced
<i>Riverside County</i>		
Riverside Portland Cement Co.	800 Corporation Bldg., Los Angeles	Riverside
<i>San Benito County</i>		
Pacific Portland Cement Co.	Hunter Dulin Bldg., San Francisco	San Juan
<i>San Bernardino County</i>		
Golden State Portland Cement Co. .	800 Corporation Bldg., Los Angeles	Oro Grande
Southwestern Portland Cement Co. .	Victorville	Victorville
California Portland Cement Co.	1228 Pac. Mutual Bldg., Los Angeles	Colton
<i>San Mateo County</i>		
Pacific Portland Cement Co.	111 Sutter St., San Francisco..	Redwood City
<i>Santa Cruz County</i>		
Santa Cruz Portland Cement Co.	Crocker Bldg., San Francisco..	Davenport
<i>Solano County</i>		
Pacific Portland Cement Co.	111 Sutter St., San Francisco..	Cement

CLAY

(Including producers of crude clay and manufacturers of brick, tile, porcelain, etc.)

	Address	Plant
Alameda County		
California Faience Co. -----	1335 Hearst Ave., Berkeley----	Berkeley
California Pottery Co. -----	2265 E. 12th St., Oakland----	-----
N. Clark & Sons -----	116 Natoma St., San Francisco--	Oakland
California Brick Plant, W. S. Dickey Clay Mfg. Co. -----	604 Mission St., San Francisco--	Pablico and Livermore
Electrical Porcelain Works -----	2416 6th St., Berkeley-----	Berkeley
Kraftile Co. -----	55 New Montgomery, San Francisco	Niles
Livermore Clay and Sand Co. ---	P. O. Box 521, Livermore-----	Tesla
M. and S. Tile Co. -----	Decoto-----	Decoto
Miller's Oakland Art Pottery----	2237 E. 12th St., Oakland----	-----
Muresque Tiles, Inc. -----	1001 22d Ave., Oakland-----	-----
Remillard Brick Co. -----	332 Phelan Bldg., San Francisco--	Pleasanton
Technical Porcelain and China Ware Co. -----	420 Kains Ave., Albany, via Berkeley -----	Albany
Walrich Pottery -----	1285 Hearst Ave., Berkeley----	Berkeley
Westinghouse High Voltage Insulator Co. -----	62d and Green Sts., Oakland---	-----
Amador County		
M. J. Bacon -----	Ione-----	Carbondale
Carlisle Clay Co. -----	Ione-----	Ione
N. Clark and Sons -----	116 Natoma St., San Francisco--	Ione
Ione Clay and Sand Co., California Mineral Products Co. ---	Kohl Bldg., San Francisco----	Ione
Ione Clay Pit, W. S. Dickey Clay Mfg. Co. -----	604 Mission St., San Francisco--	Ione
Ione Fire Brick Co. -----	541 Rialto Bldg., San Francisco--	Ione
Newman Clay Co., Newman Estate -----	Ione-----	Ione
Preston School of Industry -----	Ione-----	Ione
Yosemite Portland Cement Co.---	Merced-----	Ione
Butte County		
Coast Rock and Gravel Co., Oroville Clay Deposit -----	1000 Hunter-Dulin Bldg., San Francisco -----	Oroville
Table Mountain Clay Prod. Co.---	Oroville-----	Oroville
Calaveras County		
California Pottery Co. -----	2265 E. 12th St., Oakland----	Valley Springs
Contra Costa County		
California Art Tile Co. -----	Box 1116, Richmond -----	Richmond
N. Clark & Sons, Clark Shale Deposit -----	116 Natoma St., San Francisco--	Walnut Creek
Elsenius Pottery, C. A. Elsenius, Mgr. -----	1633 Woolsey St., Berkeley-----	Richmond
Mastercraft Tile and Roofing Co. -----	1 20th St., Richmond-----	San Pablo
Port Costa Brick Works -----	808 Sharon Bldg., San Francisco--	Port Costa
Richmond Pressed Brick Co. ---	Sharon Bldg., San Francisco----	Richmond
Standard Sanitary Mfg. Co., Pacific Mines -----	Box W., Richmond -----	Contra Costa
Fresno County		
Craycroft-Brick Co. -----	Griffith-McKnight Bldg., Fresno--	-----
Pioneer Brick and Tile Co.---	P. O. Box 614, Fresno -----	-----
Humboldt County		
J. D. Thompson Brick Co., J. D. Thompson, Mgr. -----	Box 16, Myrtle Ave., Eureka---	Eureka
Imperial County		
Simons Brick Co., Walter R. Simons -----	125 W. 3d St., Los Angeles----	El Centro

CLAY (Continued)

(Including producers of crude clay and manufacturers of brick, tile, porcelain, etc.)

	Address	Plant
Kern County		
Alluvial Silt Co., V. E. Britton--	Muroc -----	-----
Bakersfield Sandstone Erick Co., Jas. Curran, Mgr. -----	Bakersfield -----	-----
King Lumber Co. -----	1402 King St., Bakersfield-----	Bakersfield
Los Angeles County		
Acme Brick Co. -----	Hillstreet Bldg., Los Angeles---	Santa Monica
Alhambra Kilns, Inc. -----	Alhambra -----	Alhambra and Santa Monica
	3232 Alosta St., Los Angeles---	-----
American Refractories Co. -----	Reseda, Los Angeles-----	Reseda
Angulo Tile Plant, R. F. Angulo & Sons -----	Box 938, R.F.D. 2, Los Angeles.	-----
Atlas Firebrick Co. -----	Stanford St., Santa Monica-----	Santa Monica
Aztec Tile, Inc. -----	1724 Stanford St., Santa Monica.	Santa Monica
Bay Cities Roofing Co., Inc. -----	2633 Artesian St., Los Angeles---	-----
Batchelder-Wilson Tile Co. -----	415 W. Avenue 33, Los Angeles---	-----
J. A. Bauer Pottery Co., Inc.-----	South Gate -----	-----
California Clay Products Co.-----	3101 San Fernando Blvd., Los Angeles -----	-----
Claycraft Potteries -----	Inglewood -----	Inglewood
H. F. Coors Co., Inc.-----	Monterey Pass Road, 5301 Chi- cago St., Los Angeles-----	-----
Davidson Brick Co. -----	Burbank -----	-----
Empire China Co. -----	911 Mateo St., Los Angeles-----	Covina
The Feather-Stone Co. -----	1149 Mission Road, Los Angeles---	-----
Italian Terra Cotta Co. -----	701 Merch. National Bank Bldg., Los Angeles -----	-----
K & K Brick Co., C. J. Kuback, Pres. -----	2318 E. 52d St., Los Angeles---	-----
	1078 Mission Road, Los Angeles---	-----
K & M Pottery Co. -----	243 E. 7th St., Long Beach-----	-----
Los Angeles Brick Co. -----	119 N. Larchmont St., Los An- geles -----	-----
Long Beach Brick Co., Inc., H. A. Havner, Mgr. -----	15209 Saugus St., Van Nuys-----	Van Nuys
Malibu Potteries Co. -----	5547 Alhambra Road, Los An- geles -----	Alhambra
Mission Brick Co. -----	650 Chamber of Commerce Bldg., Los Angeles -----	L. A. and Los Nietos
National Brick Co. -----	Pomona -----	Pomona
Pacific Clay Products -----	5600 Miles Ave., Huntington Park -----	-----
	Pomona -----	Pomona
Pomona Brick Co. -----	Avalon -----	Santa Catalina Island
Poxon China Co. -----	453 S. Spring St., Los Angeles---	Santa Monica
Pomona Tile Co. -----	125 W. 3d St., Los Angeles-----	-----
Santa Catalina Island Co., Wm. Wrigley, Jr. -----	580 Chamber of Commerce Bldg., Los Angeles -----	-----
Santa Monica Brick Co. -----	2464 E. 9th St., Los Angeles---	-----
Simons Brick Co., Walter R. Simons -----	660 Market St., San Francisco---	Tropico, Los Angeles and Santa Monica
Standard Erick Co. -----	128 S. Avenue 64, Los Angeles---	-----
St. Louis Fire Brick and Clay, Joseph Mesmer -----	2300 E. 52d St., Los Angeles---	Vernon
Tropico, Los Angeles and Santa Monica Plants, Gladding, Mc- Bean and Co. -----	5100 Pacific Ave., Los Angeles---	-----
	586 Chamber of Commerce Bldg., Los Angeles -----	-----
C. M. Van Orden Co. -----	415 E. 9th St., Los Angeles---	-----
Vernon Potteries -----		
Vitrefrac Co. -----		
Western Brick Co. -----		
Whiting-Mead Pottery Co. -----		

CLAY (Continued)

(Including producers of crude clay and manufacturers of brick, tile, porcelain, etc.)

	Address	Plant
<i>Marin County</i>		
Greenbrae Tile Plant -----	1129 Vallejo St., San Francisco.	Greenbrae
McNear Brick Co. -----	946 Monadnock Bldg., San Francisco -----	McNears
<i>Merced County</i>		
The California Pottery Co. -----	Merced -----	Merced
<i>Mendocino County</i>		
W. N. Briggs -----	Ukiah -----	-----
<i>Mono County</i>		
California Quarries Corp. -----	1300 Quilby Bldg., Los Angeles	Laws
<i>Monterey County</i>		
Joe Arca -----	Castroville -----	Castroville
Monterey Mission Tile Co. -----	Monterey -----	-----
<i>Orange County</i>		
American Fire Clay Co. -----	San Juan Capistrano -----	San Juan Cap-
El Toro Clay Co., Amer. Refrac-		istrano
tories Co. -----	3232 Alosta St., Los Angeles -----	El Toro
Emsco Clay Co. -----	8661 Dorothy Ave., South Gate -----	-----
Gladding, McBean & Co. -----	660 Market St., San Francisco -----	-----
La Bolsa Tile Co. -----	Huntington Beach -----	Smeltzer
Orange County Brick and Tile Co.	120 W. Commonwealth, Fullerton	Anaheim
Pacific Clay Products -----	650 Chamber of Commerce Bldg.,	-----
	Los Angeles -----	-----
Padre Tile Co. -----	Ehlen & Grote Bldg., Orange -----	-----
<i>Placer County</i>		
Clay Corporation of California --	Lincoln -----	Lincoln
Gladding, McBean & Co. -----	660 Market St., San Francisco --	Lincoln
Lincoln Clay Products Co., M. J.		
Dillman, Mgr. -----	Lincoln -----	-----
<i>Riverside County</i>		
Alberhill Coal and Clay Co., Geo.		
C. Hill -----	Alberhill -----	Alberhill
Emsco Clay Co. -----	5701 S. Boyle Ave., Vernon -----	Corona
G. R. Freeman -----	Corona -----	-----
Gladding, McBean & Co. -----	660 Market St., San Francisco --	-----
Hancock's Brick Yard, C. P.		
Hancock & Son -----	1330 Lemon St., Riverside -----	-----
Los Angeles Brick Co. -----	1078 Mission Road, Los Angeles	Alberhill
Pacific Clay Products -----	650 Chamber of Commerce Bldg.,	-----
	Los Angeles -----	-----
Tarwater & Southard -----	Murietta -----	Murietta
Temescal Water Co. -----	Temescal, via Corona -----	Temescal
<i>Sacramento County</i>		
Cannon & Co. -----	Box 281, Sacramento -----	Ben Ali
H. C. Muddox -----	30th and L Sts., Sacramento -----	-----
Natoma Clay Co. -----	401 Hobart Bldg., San Francisco	Natomas
Panama Pottery Co. -----	Box 1478, R.F.D. 4, 24th St.	-----
	Road, Sacramento -----	-----
Sacramento Brick Co. -----	1400 Front St., Sacramento -----	-----
Valley Brick Co. -----	1917 Stockton Blvd., Sacramento	-----
<i>San Bernardino County</i>		
Kennedy Clay Pit, John Kennedy	Daggett -----	Daggett
<i>San Diego County</i>		
American Encaustic Tile Co. -----	52d and Alameda Sts., Los Angeles	El Cajon
		Rose Canyon
Atlas Brick and Clay Co. -----	3533 Herbert St., San Diego -----	Encinitas
California Clay Products Co. ---	South Gate -----	-----
National Brick Co. -----	24th St. and National Blvd.,	National City
	National City -----	-----

CLAY (Continued)

(Including producers of crude clay and manufacturers of brick, tile, porcelain, etc.)

	Address	Plant
Old Mission Tile Co. -----	North San Diego -----	N. San Diego
Pacific Clay Products Co. -----	650 Chamber of Commerce Bldg., Los Angeles -----	-----
Union Brick Co. -----	3565 Third St., San Diego -----	-----
Vitrified Products Corp. -----	2841 Jefferson St., N. San Diego -----	-----
<i>San Francisco County</i>		
Jalanivich & Olsen -----	2930 Baker St., San Francisco --	San Francisco
<i>San Joaquin County</i>		
San Joaquin Brick Co. -----	Channel and Webber Point, Stockton -----	-----
Stockton Brick and Tile Co. ---	McKinley Ave., Stockton -----	Stockton
Stockton Fire Brick Co., John T. Roberts, Mgr. -----	Stockton -----	Stockton
<i>San Luis Obispo County</i>		
San Luis Brick Works -----	San Luis Obispo -----	-----
<i>San Mateo County</i>		
West Coast Porcelain Co. -----	P. O. Box 46, Millbrae -----	-----
<i>Santa Barbara County</i>		
Angulo Tile Works -----	Reseda -----	Santa Barbara
L. L. Brentner -----	Carpinteria -----	Carpinteria
<i>Santa Clara County</i>		
Garden City Pottery -----	560 N. 6th St., San Jose -----	-----
Handcraft Tile Co. -----	333 S. 18th St., San Jose -----	San Jose
Kartschoke Clay Products Co. ---	1098 S. 3d St., San Jose -----	-----
Platis Premier Porcelain Co., Inc.	Box 547, Santa Clara -----	-----
Remillard Erick Co. -----	332 Phelan Bldg., San Francisco	San Jose
S & S Tile Co. -----	S. 4th St., San Jose -----	-----
San Jose Brick Co. -----	Box 274, San Jose -----	-----
Coyote Creek Clay Beds, City Manager City of San Jose ---	San Jose -----	San Jose
<i>Sonoma County</i>		
Beltane Clay Deposit, Harry Weiss -----	Glen Ellen -----	Beltane
<i>Tehama County</i>		
O'Connor Bros. -----	Red Bluff -----	-----
<i>Tulare County</i>		
S. P. Brick & Tile Co. -----	1501 Pacific S. W. Bldg., Fresno	Exeter
<i>Ventura County</i>		
Dent Clay Pit, John Dent -----	Ventura -----	Ventura
Anderson & Hardison Pressed Brick Co., J. C. Hardison and G. A. Anderson -----	Santa Paula -----	Santa Paula
Peoples Lumber Co. -----	1102 Meta St., Ventura -----	-----
Selby Shale Pit, Benj. Selby ---	Ventura -----	Ventura
Ventura Excavating Co., H. Love--	Ventura -----	-----
<i>Yuba County</i>		
Marysville Brick Co. -----	312-A D St., Marysville -----	-----

COAL

	Address	Mine
<i>Amador County</i> Buena Vista Coal Mining Co., J. J. Morris, Supt.-----	R. F. D. Ione -----	Buena Vista

DIATOMACEOUS EARTH

	Address	Plant
<i>Los Angeles County</i> The Feather-Stone Co.-----	611 Mateo St., Los Angeles----	Covina
<i>Monterey County</i> Buttle Properties, Inc. ----- California Kieselguhr Co., Geo. C. Langley and W. I. Davis---- Monterey Products Co. -----	Bradley ----- San Miguel ----- Monterey -----	Bradley Bradley Del Monte
<i>Santa Barbara County</i> The Celite Co. -----	1320 S. Hope St., Los Angeles--	Lompoc
<i>Shasta County</i> Mt. Shasta Silica Co., M. H. Nemeyer -----	Weed -----	Bartle

DOLOMITE

	Address	Mine
<i>Inyo County</i> Inyo Marble Co. -----	546 San Fernando Bldg., Los Angeles -----	Keeler
<i>Monterey County</i> Pacific Coast Steel Co., Stirling Ranch-----	Rialto Bldg., San Francisco----	Natividad

FELDSPAR

	Address	Mine
<i>Kern County</i> N. W. Sweetser -----	1024 Loew State Bldg., Los Angeles -----	Rosamond
<i>Riverside County</i> American Encaustic Tiling Co.--	52 S. Alameda St., Los Angeles--	-----
<i>San Diego County</i> Pacific Mines, Standard Sanitary Mfg. Co. ----- Globe Tile and Porcelain Works, Inc., White Rose Mine-----	P. O. Box W, Richmond----- Hynes -----	Campo Campo

FULLER'S EARTH

	Address	Mine
<i>Inyo County</i> Commercial Minerals Co.-----	58 Sutter St., San Francisco-----	-----
<i>San Bernardino County</i> Death Valley Clay Co.-----	1212 Pac. Mutual Bldg., Los Angeles -----	Bradford Station
Martin Minerals Co., Gus G. Martin-----	Slauson and Alameda Sts., Los Angeles -----	Daggett
<i>San Diego County</i> General Petroleum Corp., Mosto Otaylite Deposit-----	1003 Higgins Bldg., Los Angeles	Otay
Standard Oil of California-----	Standard Oil Bldg., San Francisco -----	Otay

GEMS

	Address	Mine
<i>Butte County</i> William Fliedner----- C. E. Grant-----	Route A., Oroville----- Cherokee, via Oroville-----	Cherokee Cherokee
<i>Calaveras County</i> Green Mountaine Mine, J. J. McSorley, Mgr.-----	Mokelumne Hill-----	Mokelumne Hill
<i>El Dorado County</i> D. R. Douglas-----	580 Market St., San Francisco-----	-----
<i>San Bernardino County</i> Franklin Heald-----	Fontana -----	Victorville
<i>San Diego County</i> Pala Chief Gem Mining Co., Frank A. Salmons----- Hercules Group, A. W. Pray and E. G. Logan----- J. W. Ware-----	U. S. Grant Bldg., San Diego--- 243 Kansas St., Escondido----- 1060 6th St., San Diego-----	Pala Smith Mountain

GRANITE

	Address	Plant
<i>Fresno County</i>		
Academy Granite.....	Academy	Academy
Grant Rock and Gravel Co.....	Box 958, Fresno.....	Friant
Superior Granite Co., Inc.....	Clovis	Academy
<i>Inyo County</i>		
Bly Stone Co. (tuff).....	1985 E. 16th St., Los Angeles.....	Round Valley
<i>Lassen County</i>		
Lassen County.....	Susanville	Susanville
<i>Los Angeles County</i>		
R. O. Stein Co.....	San Gabriel	San Gabriel
<i>Madera County</i>		
McGilvray-Raymond Granite Co.....	634 Townsend St., San Francisco.....	Raymond
Raymond Granite Co., Inc.....	3 Potrero Ave., San Francisco..	Knowles
<i>Mariposa County</i>		
Kelm Jasper Quarry, H. J. Kelm..	Bagby	Bagby
<i>Nevada County</i>		
Netz Granite Quarry, Ludwig		
Netz.....	Nevada City	Nevada City
<i>Placer County</i>		
Alexson Granite Co.....	Rocklin	Rocklin
Adolph Pernu & Sons.....	Rocklin	Rocklin
Union Granite Co., Mat Ruhkals..	Rocklin	Rocklin
<i>Plumas County</i>		
Paul Sonognini.....	Chilecoot	Chilecoot
<i>Sacramento County</i>		
Folsom State Prison.....	Represa.....	Represa
<i>San Diego County</i>		
Crystal Black Quarry, John		
Stridsburg.....	Escondido	Spooks Canyon
McGilvray-Raymond Granite Co.....	634 Townsend St., San Francisco	Lakeside
Magee Quarry, Robert J. McGee..	Pala	Pala
Meyer Granite Quarry, W. A.		
Meyer.....	Lakeside	Lakeside
Simpson-Pirnie Granite Co.,		
Santee Quarry.....	21st and N Sts., San Diego.....	
<i>Tulare County</i>		
California Granite Co.....	Porterville	Porterville

GRAPHITE

	Address	Mine
<i>Los Angeles County</i>		
Verduga Mountain Graphite,		
Standard Graphite Co.....	P. O. Box 338, Glendale.....	Montrose

GYPSUM

	Address	Quarry
<i>Imperial County</i> Pac. Portland Cement-----	111 Sutter St., San Francisco---	Westmoreland
<i>Kern County</i> Koehn Gypsum Plant, Chas. Koehn-----	Saltdale -----	Saltdale
<i>Riverside County</i> E. R. Nonhoff----- U. S. Gypsum Co.-----	1116 Ramona St., Corona----- 1105 Edwards & Wildey Bldg., Los Angeles -----	Corona Blythe

IRON AND TITANIUM

	Address	Mine
<i>Los Angeles County</i> Iron Blossom Group----- Burdick Minerals Corporation---	Los Angeles ----- Hermosa Beach-----	Lang Hermosa Beach

LIME AND LIMESTONE

	Address	Quarry
<i>Contra Costa County</i> Mt. Diablo Lime Marl Co.-----	Ray Bldg., Oakland -----	Walnut Creek
<i>El Dorado County</i> Eldorado Lime and Mining Co.--- Pacific Portland Cement Co.-----	Shingle Springs ----- 111 Sutter St., San Francisco----	Shingle Springs -----
<i>Inyo County</i> Inyo Chemical Co.-----	1005 Pershing Square Bldg., Los Angeles -----	Cartago
<i>Kern County</i> Summit Lime Plant, Union Lime Co., Lessee-----	2135 Bay St., Los Angeles-----	Tehachapi
<i>Los Angeles County</i> Torrance Lime and Fertilizer Co.---	Torrance -----	Torrance
<i>Plumas County</i> Pyramid Lime Co.-----	Quincy -----	Quincy
<i>Riverside County</i> San Jacinto Rock Products Co., G. W. Green-----	San Jacinto -----	San Jacinto
<i>San Bernardino County</i> California Portland Cement Co.---	1228 Pac. Mutual Bldg., Los An- geles -----	Colton
Chas. I. Chubbuck-----	123 25th Ave., San Francisco----	Silver Lake
Pacific Coast Talc Co.-----	2149 Bay St., Los Angeles-----	Victorville
Victorville Lime Rock Co.-----	2149 Bay St., Los Angeles-----	Victorville
<i>San Mateo County</i> Pacific Portland Cement Co.-----	111 Sutter St., San Francisco----	San Mateo
<i>Santa Cruz County</i> Henry Cowell Lime and Cement Co.-----	2 Market St., San Francisco-----	Santa Cruz
Holmes Lime & Cement Co.-----	2 Pine St., San Francisco-----	Santa Cruz
Pacific Limestone Products Co.---	Spring St., Santa Cruz-----	Santa Cruz
Santa Cruz Portland Cement Co.---	Crocker Bldg., San Francisco----	Davenport
<i>Shasta County</i> Briggsville Limestone Quarry----	Box 604, Redding-----	Girvan
<i>Tulare County</i> Kaweah Quarries-----	Lemon Cove -----	Lemon Cove
Abramson & Bode Corp.-----	Lindsay -----	Lindsay
<i>Tuolumne County</i> Pacific Lime and Plaster Co.-----	Sonora -----	Sonora

LITHIA

	Address	Mine
<i>San Diego County</i> Stewart Lithia Mine, National Industry Chemical Corp.-----	Pala, Cal. -----	Pala

MAGNESITE

	Address	Plant
<i>Los Angeles County</i> C. M. Van Orden Co.-----	128 S. Avenue 64, Los Angeles----	-----
<i>San Benito County</i> Sampson Magnesite Co.-----	803 Balfour Bldg., San Francisco	Sampson Pk.
<i>Santa Clara County</i> Western Magnesite Mine, C. S. Malty, Lessee-----	San Francisco-----	Red Mountain
<i>Stanislaus County</i> Red Mtn. Magnesite Co.-----	906 First Natl. Bank Bldg., San Francisco -----	Red Mountain
Bald Eagle Magnesite Mine, A. D. Davenport-----	Gustine -----	-----
<i>Tulare County</i> E. F. Schrel-----	Lindsay -----	Lindsay
Sierra Magnesite Co.-----	233 Sansome St., San Francisco-	Porterville

MAGNESIUM SALTS

	Address	Plant
<i>Alameda County</i> California Chemical Corp.-----	233 Sansome St., San Francisco-	Newark
<i>Inyo County</i> American Magnesium Co.-----	242 Wilcox Bldg., Los Angeles-	Death Valley
<i>San Diego County</i> California Chemical Corp.-----	233 Sansome St., San Francisco-	-----

MINERAL PAINT

	Address	Plant
<i>Stanislaus County</i> V. J. Winkler-----	Knights Ferry -----	-----

MINERAL WATER

	Address	Spring
<i>Butte County</i>		
Polk Springs, Wm. Polk, Mgr.	Chico -----	Chico
Richardson Springs, Lee Richardson, Mgr.	Chico -----	Chico
<i>Calaveras County</i>		
Mok-Hill Mineral Spring, Zumwalt, Dahl, Zumwalt	Mokelumne Hill -----	Mokelumne Hill
<i>Central Costa County</i>		
Alhambra Springs	Martinez -----	
<i>Fresno County</i>		
Merced Mineral Springs Co., F. J. Eburn, Pres.	Los Banos -----	Los Banos
<i>Lake County</i>		
Adams Minerals Springs, Clarence Prather	Adams, via Middletown -----	Adams
Portett Spring Co.	71 Bluxome St., San Francisco	
Norman Medical Springs, H. C. Norman, Mgr.	Middletown -----	Middletown
Spiers Springs, Joshua Spiers	Middletown -----	Middletown
Witter Medical Springs	995 Market St., San Francisco	Witter Springs
<i>Los Angeles County</i>		
Holly Springs Water Co.	2284 Holly Drive, Los Angeles	
Magnetic Spring Water Co.	936 Palm Ave., Sherman	
Mountain Spring Water Co.	226 S. Avenue 54, Los Angeles	
Rose Springs-California Spring Water Co.	4835 Pasadena Ave., Los Angeles	
<i>Marin County</i>		
Tamapais Natural Mineral Water Springs, Borello Bros.	San Rafael -----	
<i>Napa County</i>		
G. Musante	Calistoga -----	Calistoga
Napa Soda Springs Co.	1142 Mission St., San Francisco	
Napa Vichy Springs, John Lepori	Napa -----	
Samuels Soda Springs, R. J. Little	Monticello -----	
<i>Riverside County</i>		
Beulah Springs, Oscar C. Nicholl	Arlington -----	Arlington
<i>San Benito County</i>		
San Benito Min. Spring Co., E. J. Anderson	Box 632, Hollister -----	
<i>San Bernardino County</i>		
Arrowhead Hot Springs Co.	Washington St. and Compton Ave., Los Angeles	Arrowhead
<i>San Diego County</i>		
Buckman Springs	3984 Idaho St., San Diego	
El Granito Spring Bottling Co.	472 10th St., San Diego	El Cajon
Rock Springs Co., E. S. Walck	Escondido -----	Escondido
<i>San Luis Obispo County</i>		
Mary Hill Mineral Well Co., Fred Merckel	Paso Robles -----	Paso Robles
<i>Santa Barbara County</i>		
Pinkham Mineral Spring Co., E. F. Pinkham	1815 Bath St., Santa Barbara	
Veronica Springs Co.	Salsipuedes St., Santa Barbara	
<i>Santa Clara County</i>		
San Jose Water Co.	397 N. 2d St., San Jose	

MINERAL WATER—Continued

	Address	Spring
<i>Siskiyou County</i> Shasta Water Co.-----	6th and Brannan Sts., San Francisco -----	Dunsmuir

APPENDIX B.

MINING BUREAU ACT.

Chapter 679.

[Stats. 1913.]

An act establishing a state mining bureau, creating the office of state mineralogist, fixing his salary and prescribing his powers and duties; providing for the employment of officers and employees of said bureau, making it the duty of persons in charge of mines, mining operations and quarries to make certain reports, providing for the investigation of mining operations, dealings and transactions and the prosecution for defrauding, swindling and cheating therein, creating a state mining bureau fund for the purpose of carrying out the provisions of this act and repealing an act entitled "An act to provide for the establishment, maintenance, and support of a bureau, to be known as the state mining bureau, and for the appointment and duties of a board of trustees, to be known as the board of trustees of the state mining bureau, who shall have the direction, management and control of said state mining bureau, and to provide for the appointment, duties, and compensation of a state mineralogist, who shall perform the duties of his office under the control, direction and supervision of the board of trustees of the state mining bureau," approved March 23, 1893, and all acts amendatory thereof and supplemental thereto or in conflict herewith.

[Approved June 16, 1913. In effect August 10, 1913.]

The people of the State of California do enact as follows:

SECTION 1. There is hereby created and established a state mining bureau. The chief officer of such bureau shall be the state mineralogist, which office is hereby created.

SEC. 2. It shall be the duty of the governor of the State of California and he is hereby empowered to appoint a citizen and resident of this state, having a practical and scientific knowledge of mining, to the office of state mineralogist. Said state mineralogist shall hold his office at the pleasure of the governor. He shall be a civil executive officer. He shall take and subscribe the same oath of office as other state officers. He shall receive for his services a salary of three hundred dollars (\$300) per month, to be paid at the same time and in the same manner as the salaries of other state officers. He shall also receive his necessary traveling expenses when traveling on the business of his office. He shall give bond for the faithful performance of his duties in the sum of ten thousand dollars (\$10,000), said bond to be approved by the governor of the State of California.

SEC. 3. Said state mineralogist shall employ competent geologists, field assistants, qualified specialists and office employees when necessary in the execution of his plans and operations of the bureau, and fix their compensation. The said employees shall be allowed their necessary traveling expenses when traveling on the business of said department and shall hold office at the pleasure of said state mineralogist.

SEC. 4. It shall be the duty of said state mineralogist to make, facilitate, and encourage, special studies of the mineral resources and mineral industries of the state. It shall be his duty: to collect statistics concerning the occurrence and production of the economically important minerals and the methods pursued in making their valuable constituents available for commercial use; to make a collection of typical geological and mineralogical specimens, especially those of economic and commercial importance, such collection constituting the museum of the state mining bureau; to provide a library of books, reports, drawings, bearing upon the mineral industries, and sciences of mineralogy and geology, and arts of mining and metallurgy, such library constituting the library of the state mining bureau; to make a collection of models, drawings and descriptions of the mechanical appliances used in mining and metallurgical processes; to preserve and so maintain such collections and library as to make them available for reference and examination, and open to public inspection at reasonable hours; to maintain, in effect, a bureau of information concerning the mineral industries of this state, to consist of such collections and library, and to arrange, classify, catalogue, and index the data therein contained, in a manner to make the information available to those desiring it; to issue from time to time such bulletins as he may deem advisable concerning the statistics and technology of the mineral industries of this state.

19—62279

SEC. 5. It is hereby made the duty of the owner, lessor, lessee, agent, manager or other person in charge of each and every mine, of whatever kind or character, within the state, to forward to the state mineralogist, upon his request, at his office not later than the thirtieth day of June, in each year, a detailed report upon forms which will be furnished showing the character of the mine, the number of men then employed, the method of working such mine and the general condition thereof, the total mineral production for the past year, and such owner, lessor, lessee, agent, manager or other person in charge of any mine within the state must furnish whatever information relative to such mine as the state mineralogist may from time to time require for the proper discharge of his official duties. Any owner, lessor, lessee, agent, manager or other person in charge of each and every mine, of whatever kind or character within the state, who fails to comply with the above provisions shall be deemed guilty of a misdemeanor.*

SEC. 6. The state mineralogist now performing the duties of the office of state mineralogist shall perform the duties of the office of state mineralogist as in this act provided until the appointment and qualification of his successor as in this act provided.

SEC. 7. The said state mineralogist shall take possession, charge and control of the offices now occupied and used by the board of trustees and state mineralogist and the museum, library and laboratory of the mining bureau located in San Francisco as provided for by a certain act of the legislature approved March 23, 1893, and hereafter referred to in section fourteen hereof, and shall maintain such offices, museum, library and laboratory for the purposes provided in this act.

SEC. 8. Said state mineralogist or qualified assistant shall have full power and authority at any time to enter or examine any and all mines, quarries, wells, mills, reduction works, refining works and other mineral properties or working plants in this state in order to gather data to comply with the provisions of this act.

SEC. 9. The state mineralogist shall make a biennial report to the governor on or before the fifteenth day of September next preceding the regular session of the legislature.

SEC. 10. All moneys received by the state mining bureau or any officer thereof (except such as may be paid to them by the state for disbursement) shall be receipted for by the state mineralogist or other officer authorized by him to act in his place and at least once a month accounted for by him to the state controller and paid into the state treasury to the credit of a fund which is hereby created and designated "state mining bureau fund." All moneys now in the possession of the state mining bureau or any officer thereof received from any source whatsoever, shall be immediately paid over to the state mineralogist and by him accounted for to the controller and paid into the state treasury to the credit of said fund. Said fund shall be used and is hereby appropriated for the use of said bureau in carrying out the purposes of this act.

SEC. 11. The said state mineralogist is hereby authorized and empowered to receive on behalf of this state, for the use and benefit of the state mining bureau, gifts, bequests, devises and legacies of real or other property and to use the same in accordance with the wishes of the donors, and if no instructions are given by said donors, to manage, use, and dispose of the gifts and bequests and legacies for the best interests of said state mining bureau and in such manner as he may deem proper.

SEC. 12. The state mineralogist may, whenever he deems it advisable, prepare a special collection of ores and minerals of California to be sent to or used at any world's fair or exposition in order to display the mineral wealth of the state.

SEC. 13. The state mineralogist is hereby empowered to fix a price upon and to dispose of to the public, at such price, any and all publications of the state mining bureau, including reports, bulletins, maps, registers or other publications, such price shall approximate the cost of publication and distribution. Any and all sums derived from such disposition, or from gifts or bequests made, as hereinbefore provided must be accounted for by said state mineralogist and turned over to the state treasurer to be credited to the mining bureau fund as provided for in section ten. He is also empowered to furnish without cost to public libraries the publications of the bureau and to exchange publications with other geological surveys and scientific societies, etc.

*Sec. 19 of the Penal Code of California provides: "Except in cases where a different punishment is prescribed by this code, every offense declared to be a misdemeanor is punishable by imprisonment in a county jail not exceeding six months, or by a fine not exceeding five hundred dollars, or by both."

SEC. 14. The state mineralogist provided for by this act shall be the successor in interest of the board of trustees of the state mining bureau, and the state mineralogist, under and by virtue of that certain act, entitled "An act to provide for the establishment, maintenance, and support of a bureau, to be known as the state mining bureau, and for the appointment and duties of a board of trustees, to be known as the board of trustees of the state mining bureau, who shall have the direction, management, and control of said state mining bureau, and to provide for the appointment, duties, and compensation of a state mineralogist, who shall perform the duties of his office under the control, direction and supervision of the board of trustees of the state mining bureau," approved March 23, 1893, and all books, papers, documents, personal property, records, and property of every kind and description obtained or possessed, or held or controlled by the said board of trustees of the said state mining bureau, and the state mineralogist, and the clerks and employees thereof, under the provisions of said act of March 23, 1893, or any act supplemental thereto or amendatory thereof, shall immediately be turned over and delivered to the said state mineralogist herein provided for, who shall have charge and control thereof.

SEC. 15. That certain act entitled "An act to provide for the establishment, maintenance, and support of a bureau, to be known as the state mining bureau, and for the appointment and duties of a board of trustees, to be known as the board of trustees of the state mining bureau, and to provide for the appointment, duties and compensation of a state mineralogist, who shall perform the duties of his office under the control, direction, and supervision of the board of trustees of the state mining bureau," approved March 23, 1893, together with all acts amendatory thereof and supplemental thereto and all acts in conflict herewith are hereby **repealed**.

DEPARTMENT OF NATURAL RESOURCES ACT.

Chapter 128.

[Stats. 1927.]

An act to add a new article to chapter three of title one of part three of the Political Code to be numbered article two J, embracing sections three hundred seventy-three to three hundred seventy-three I, relating to a department of natural resources.

[Approved by the Governor April 13, 1927.]

The people of the State of California do enact as follows:

SECTION 1. The Political Code is hereby amended by adding a new article to chapter III of title I of part III thereof, to be numbered article IIj, embracing sections 373 to 373i and to read as follows:

ARTICLE IIj.

DEPARTMENT OF NATURAL RESOURCES.

373. A department of the government of the State of California to be known as the department of natural resources is hereby created. The department shall be conducted under the control of an executive officer to be known as the director of natural resources, which office is hereby created. The director shall be appointed by and hold office at the pleasure of the governor and shall receive a salary of six thousand dollars per annum.

Except as in this article otherwise provided, the provisions of article II of this chapter, title, and part of the Political Code as adopted at the forty-fourth session of the Legislature and as the same may be amended from time to time, shall govern and apply to the conduct of the department of natural resources in every respect the same as if such provisions were herein set forth at length and wherever in said article II the term "head of the department" or similar designation occurs, the same shall for the purposes of this article mean the director of natural resources.

373a. For purposes of administration the department shall be forthwith organized by the director thereof, subject to the approval of the governor, in such manner as he shall deem necessary to properly segregate and conduct the work of the department, and the director shall have power to appoint in accordance with the civil service and other provisions of law such deputies, officers and other expert and clerical assistants as may be necessary. The work of the department is hereby divided into at least four divisions to be known as the division of mines and mining, the division of forestry, the division of parks and the division of fish and game.

373b. The division of mines and mining shall be administered through a chief of division who shall also be known as the state mineralogist. He shall be appointed by the director of natural resources and shall receive a salary of six thousand dollars per annum.

373c. The division of forestry shall be administered through a chief of division who shall be known as the state forester, who shall be a technically trained forester, appointed by the director of natural resources upon nomination by the state board of forestry hereinafter provided. General policies for the guidance of the division of forestry shall be determined by a state board of forestry which shall consist of seven members appointed by and holding office at the pleasure of the governor. Of the seven members one shall be familiar with the pine timber industry, one with the redwood industry, one with the live stock industry, one with general agriculture and one with the problems of water conservation.

373d. The division of parks shall be administered through a chief of division who shall be appointed by the director of natural resources upon nomination by the state park commission hereinafter provided. General policies for the administration of the state park system shall be determined by the state park commission which is hereby created to consist of five members appointed by the governor and holding office at his pleasure.

373e. The division of fish and game shall be administered through a fish and game commission consisting of three members appointed by and holding office at the pleasure of the governor.

373f. The chiefs of the divisions of forestry and parks respectively shall receive such salaries as may be determined by the director with the approval of the governor. The director of natural resources and the chief of each division before entering upon his duties shall execute to the State of California an official bond in the penal sum of twenty-five thousand dollars conditioned upon the faithful performance of his duties. The members of the board of forestry, the state parks commission and fish and game commission shall serve without compensation, but shall be entitled to their actual expenses incurred in the performance of their duties.

373g. The department of natural resources shall succeed to and is hereby invested with all the duties, powers, purposes, responsibilities and jurisdiction of the state mining bureau, state mineralogist, department of petroleum and gas, state oil and gas supervisor, state forester, state board of forestry, California redwood park commission, San Pasqual battlefield commission, Mount Diablo park commission, state fish and game commission, state fish and game commissioners, and, except as herein otherwise provided, of the several officers, deputies and employees of such bodies and offices, and whenever by the provisions of any statute or law now in force or that may hereafter be enacted a duty or jurisdiction is imposed or authority conferred upon any of said officers, offices, bodies, deputies or employees by any statute the enforcement of which is transferred to the department, such duty, jurisdiction and authority are hereby imposed upon and transferred to the department of natural resources and the appropriate officers thereof with the same force and effect as though the title of said department of natural resources had been specifically set forth and named therein in lieu of the name of any such body, office, officer, deputy or employee. Said bodies and offices, the duties, powers, purposes, responsibilities and jurisdiction of which are so transferred and vested in the department of natural resources, and the positions of all officers, deputies and employees thereunder, are and each of them is hereby abolished and shall have no further legal existence, but the statutes and laws under which they existed and all laws prescribing their duties, powers, purposes, responsibilities and jurisdiction, together with all lawful rules and regulations established thereunder are hereby expressly continued in force.

The department of natural resources shall be in possession and control of all records, books, papers, offices, equipment, supplies, moneys, funds, appropriations, land and other property real or personal now or hereafter held for the benefit or use of said bodies, offices and officers.

The boards of district oil and gas commissioners, the offices of district oil and gas commissioners and the board of review, correction and equalization created by the act approved June 10, 1915, establishing the department of petroleum and gas, are hereby respectively continued in force with the powers, duties, responsibilities and jurisdiction in them vested by the provisions of said act approved June 10, 1915, as amended; *provided*, that said board of review shall consist of the director of natural resources, the director of finance and the chairman of the state board of equalization.

373h. The management and control of the property acquired by the State of California under or pursuant to the provisions of the act entitled "An act to accept the gift to the state of San Pasqual battlefield in San Diego county, to provide for collecting and systematizing the history of said battle, for determining the exact location thereof, and to report a suitable method of marking said battlefield and commemorating the heroism of those Americans who fought and died there," approved May 11, 1919, is hereby transferred to and vested in the department of natural resources.

373i. From and after the date upon which this act takes effect, the department of natural resources shall be and is hereby authorized and empowered to expend the moneys in any appropriation or in any special fund in the state treasury now remaining or made available by law for the administration of the provisions of all the statutes the administration of which is committed to the department, or for the use, support, or maintenance of any board, bureau, commission, department, office or officer whose duties, powers, and functions are, by the provisions of this article, transferred to and conferred upon the department of natural resources. Such expenditures by the department shall be made in accordance with law in carrying out the purposes for which such appropriations were made or such special funds created.

PUBLICATIONS OF THE DIVISION OF MINES AND MINING

During the past forty-eight years, in carrying out the provisions of the organic act creating the former California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the office of the Division of Mines and Mining, in the Ferry Building, San Francisco; New Orpheum Building, Los Angeles; State Office Building, Sacramento; Redding; Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the above offices and enclosing the requisite amount in the case of publications that have a list price. Only coin, stamps or money orders should be sent, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the Division of Mines and Mining.

NOTE.—The Division of Mines and Mining frequently receives requests for some of the early Reports and Bulletins now out of print, and it will be appreciated if parties having such publications and wishing to dispose of them will advise this office.

DETERMINATION OF MINERAL SAMPLES

Samples (limited to three at one time) of any mineral found in the state may be sent to the Division of Mines and Mining for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the state. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.
